

Representation learning: A new approach for biomedical data

Marinka Zitnik (marinka@cs.stanford.edu)

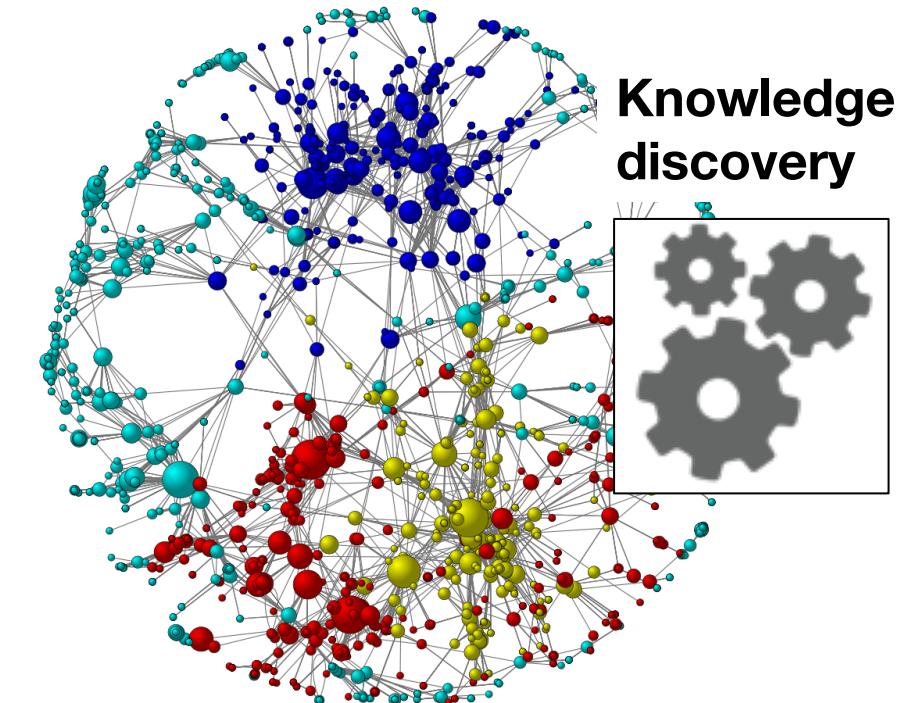

Stanford | ENGINEERING
Computer Science

Science crucially depends on scientific instruments

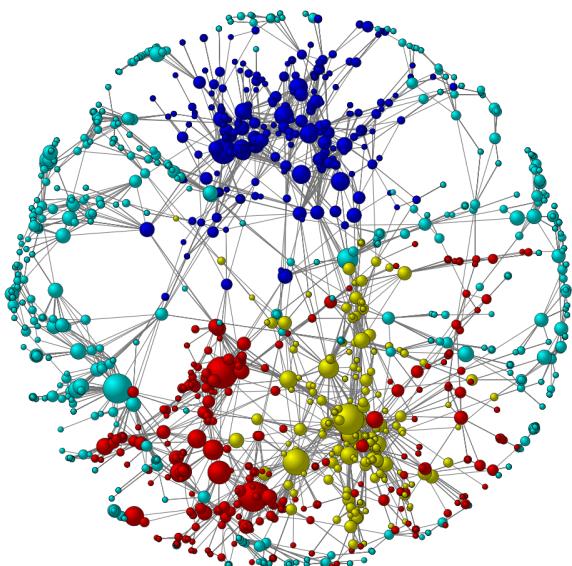

Physical instruments
facilitate discoveries

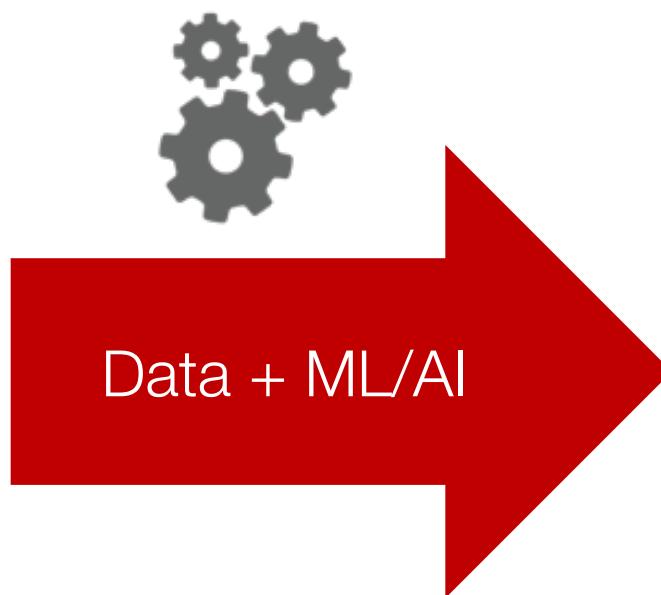

**Need instruments for modern,
data-intensive sciences**

Knowledge Discovery

Data

Predictions
and insights

Opportunities for AI in health & medicine

Preliminary diagnosis,
early disease
detection, self-care

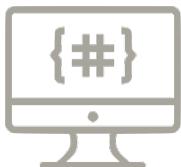

Automated image
diagnosis,
language modeling

Clinical trial participation,
drug discovery, AI-driven
medical devices

Comorbidities,
chronic disease
treatments

Improve administrative
workflows, costly
back-office problems

Inpatient & outpatient
policies of care

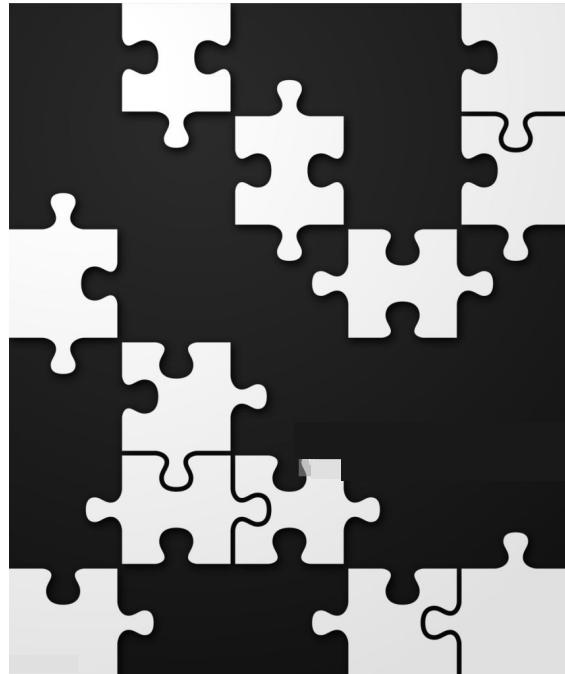

Real-time patient
interventions

Help protect health
data, avoid medical
errors

Why is it so challenging to realize this vision?

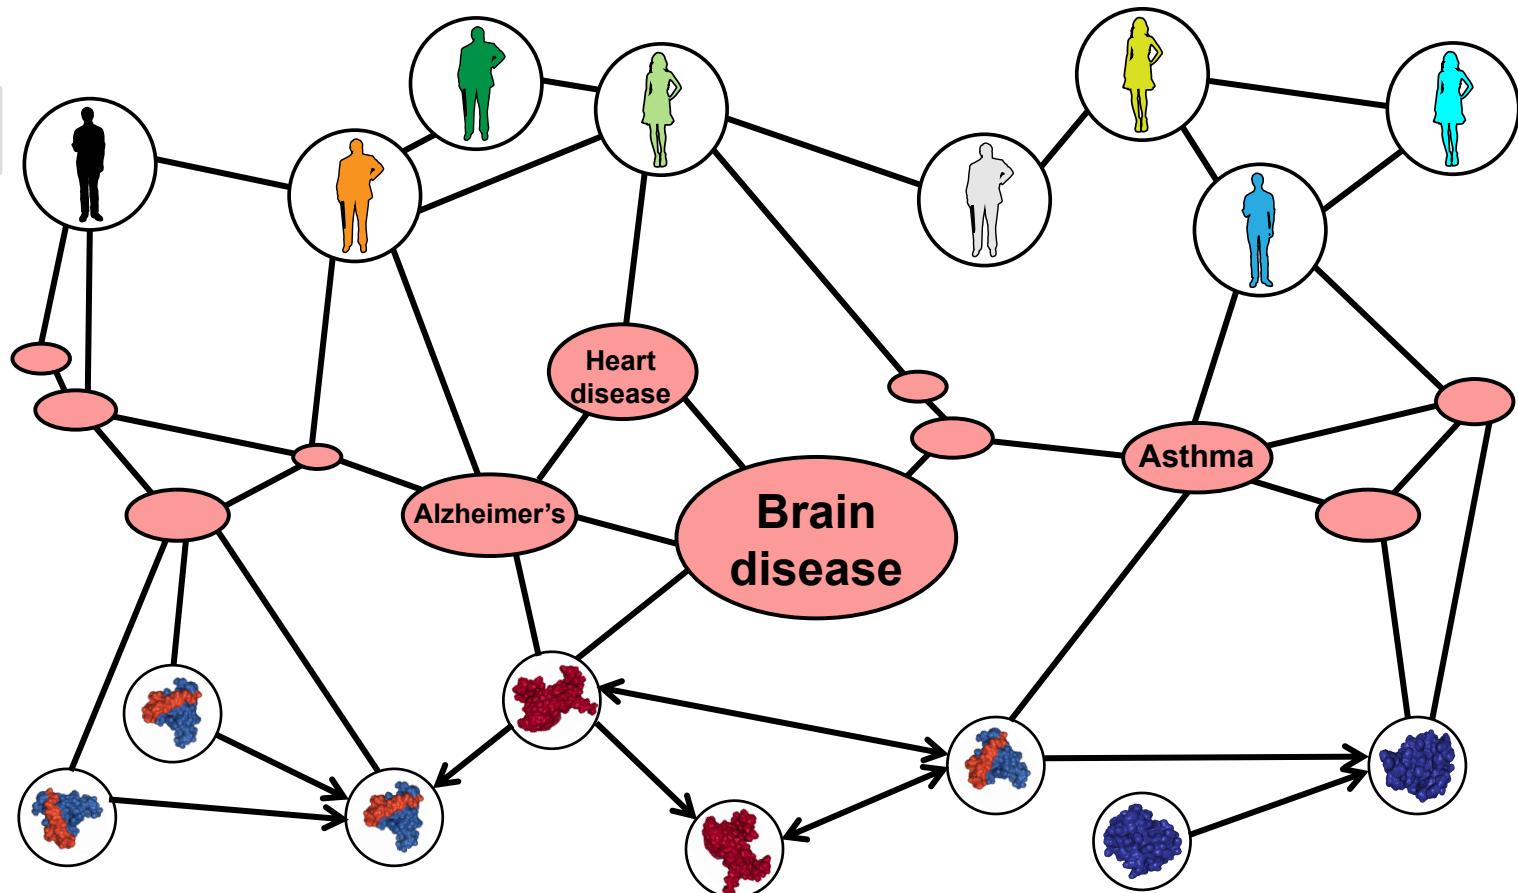

Multi-scale: molecules, individuals, populations

Heterogeneous: experimental readouts, curated annotations, self-reported

Confounded: data from different labs, hospitals, biotech platforms, species

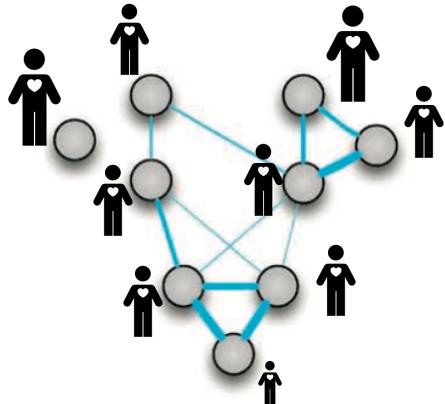

Networks allow for integration of biomedical data

Multiple scales

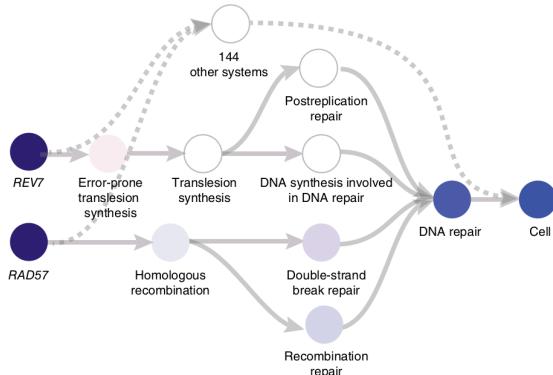

Rich, multimodal data

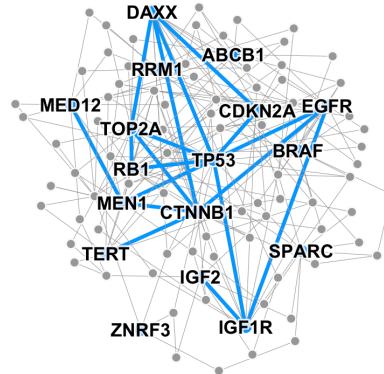

Many biomedical data are networks

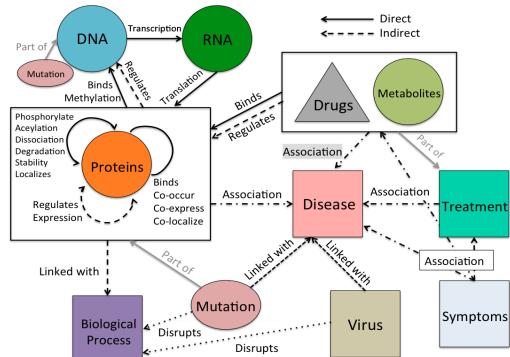

Patient networks

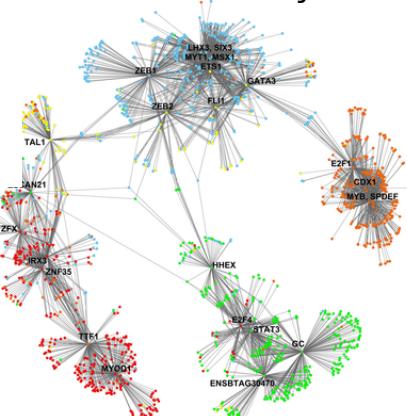

Hierarchies of cell systems

Disease pathways

Biomedical knowledge graphs

Gene interaction networks

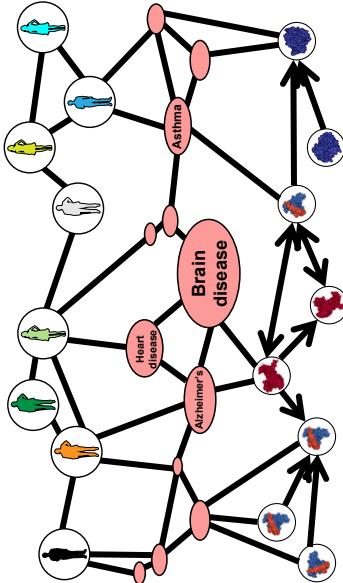

Cell-cell similarity networks

Prioritizing Network Communities, *Nature Communications* 2018

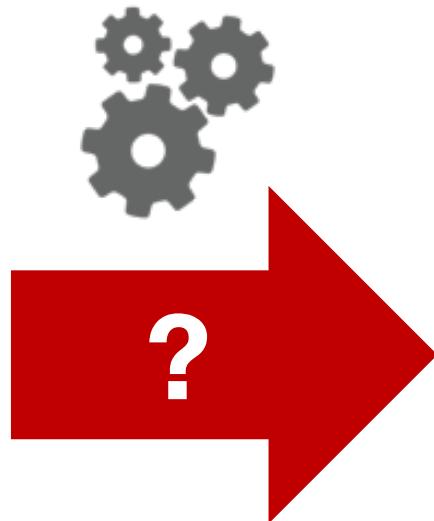

Network Enhancement as a General Method to Denoise Weighted Biological Networks, *Nature Communications* 2018

Evolution of resilience in protein interactomes across the tree of life, *PNAS* 2019

How to do machine learning on biomedical networks?

Networks

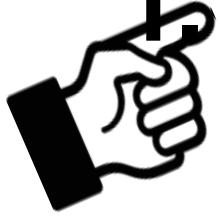

Predictions
and insights

Biomedical ML opens new avenues for:

- Understanding nature, analyzing health, and developing medicines
- How predictive modeling is performed today at the fundamental level

Today's Talk

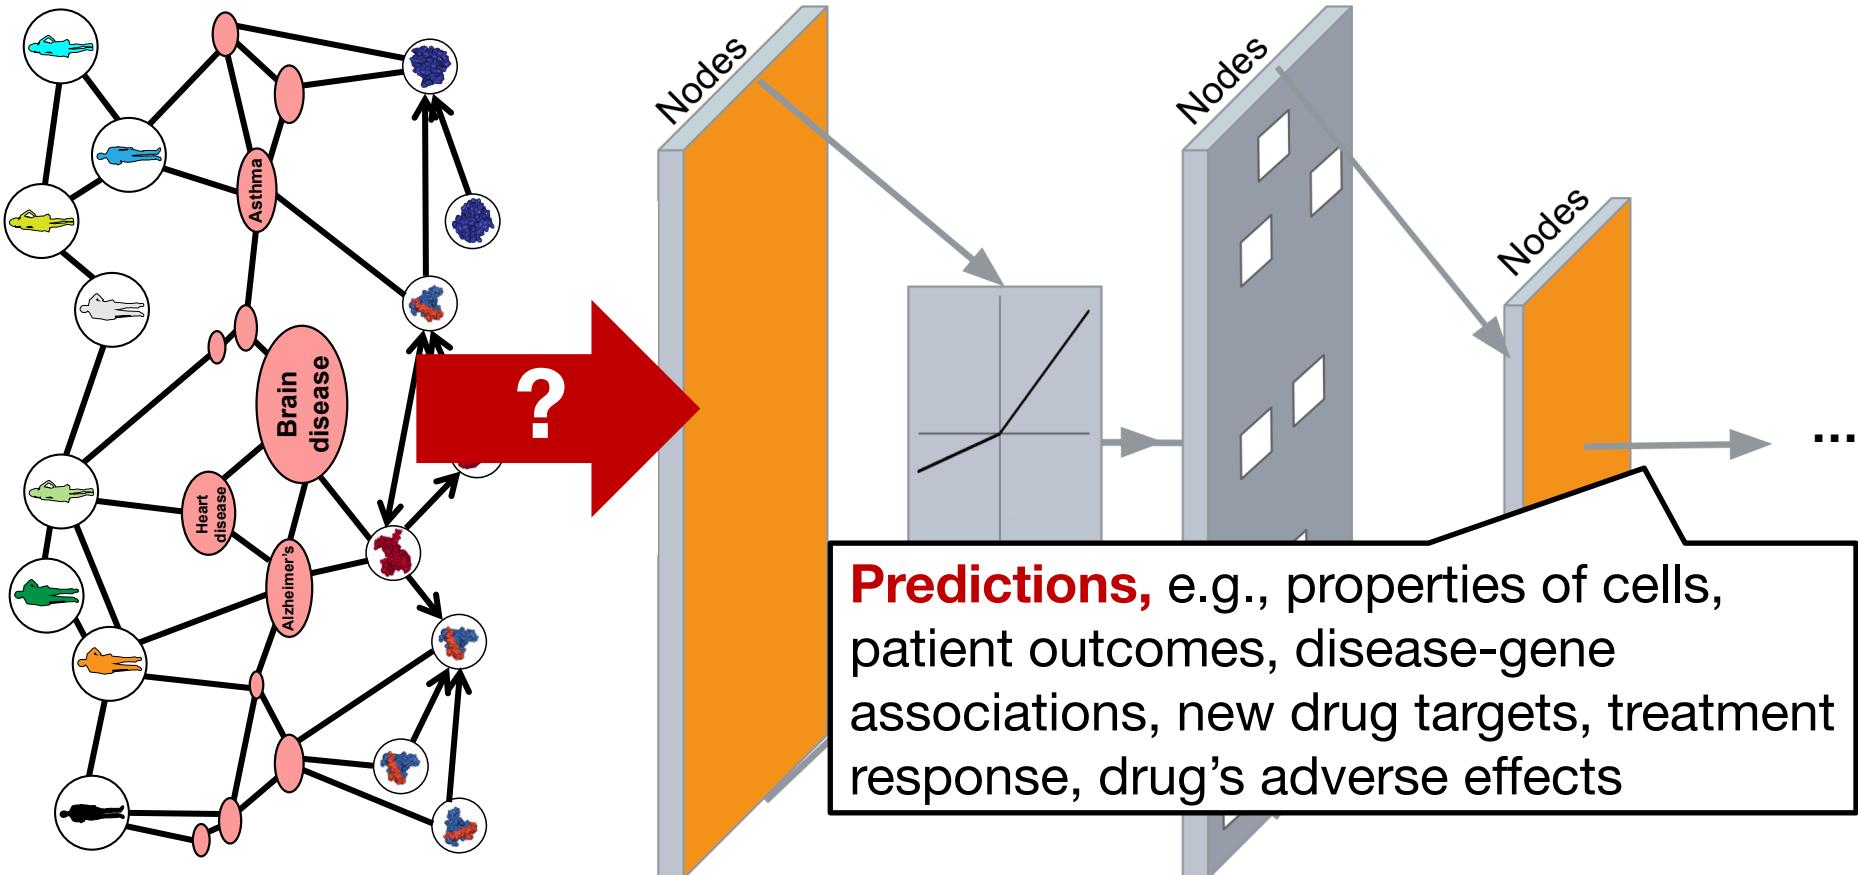

1. Representation learning for biomedical data

2. Three research applications:

- Used new approach to predict **safety** and **side effects of drug combinations**
- Used new approach to **repurpose old drugs for new diseases**
- Used new approach to **answer logical queries** on **knowledge graphs**

How to learn deep models on biomedical networks?

Networks are a powerful data representation, but are challenging to work with for prevailing ML

Prevailing Deep Models

Primarily designed for **grids** or **simple sequences**:

- CNNs for fixed-size images/grids

These models brought extraordinary gains in
**computer vision, natural language
processing, speech, and robotics**

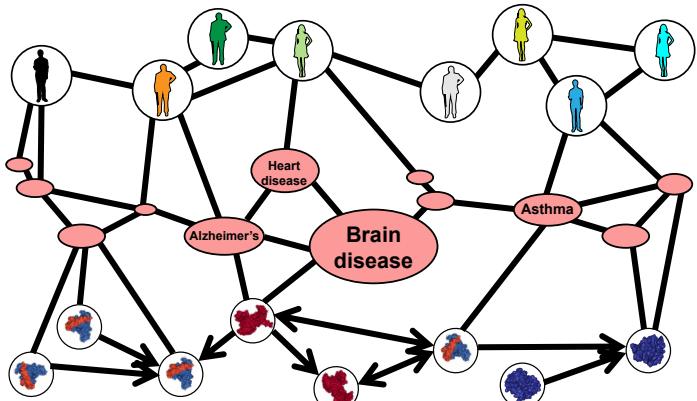

- LSTMs for text/sequences...

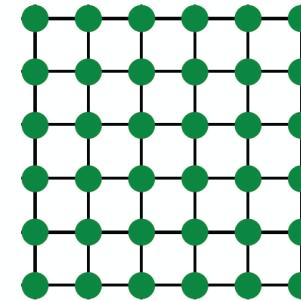

But are **unable to consider interactions**, the
essence of networks

Why is deep learning on networks hard?

Biomedical networks are far more complex!

Biomedical networks

Text

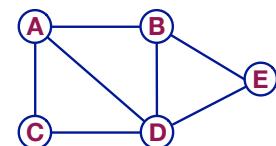

Images

Examples:

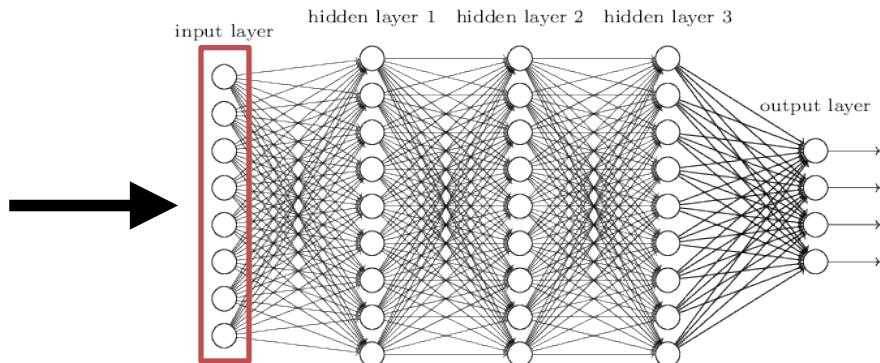

Human contact networks, Disease networks,
Patient networks, Cell similarity networks,
Medical knowledge graphs

A Naïve Approach

- Join adjacency matrix and features
- Feed them into a deep neural model:

	A	B	C	D	E	Feat
A	0	1	1	1	0	1 0
B	1	0	0	1	1	0 0
C	1	0	0	1	0	0 1
D	1	1	1	0	1	1 1
E	0	1	0	1	0	1 0

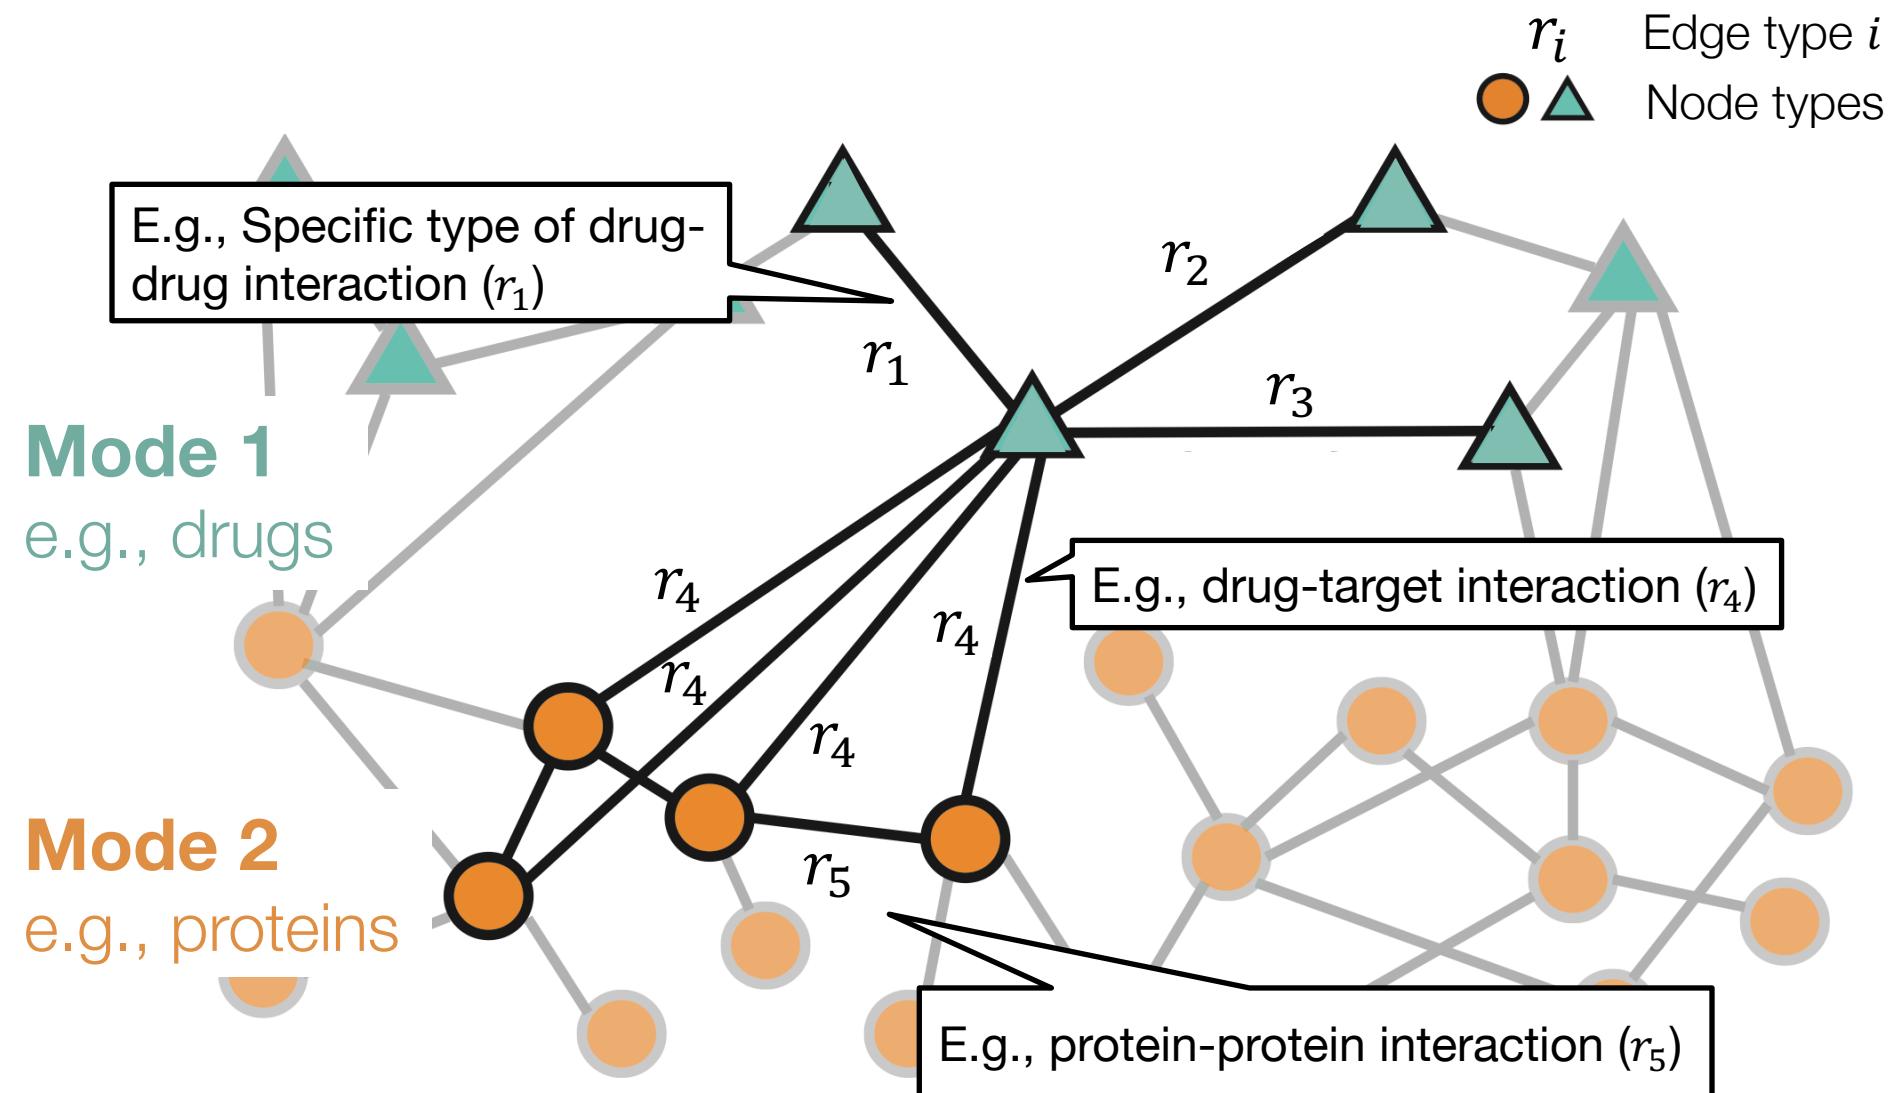

- Issues with this idea:
 - $O(N)$ parameters
 - Not applicable to graphs of different sizes
 - Not invariant to node ordering

Today's goal: Deep learning for biomedical networks

Setup: A Multimodal Network

Overview of our deep learning approach for networks

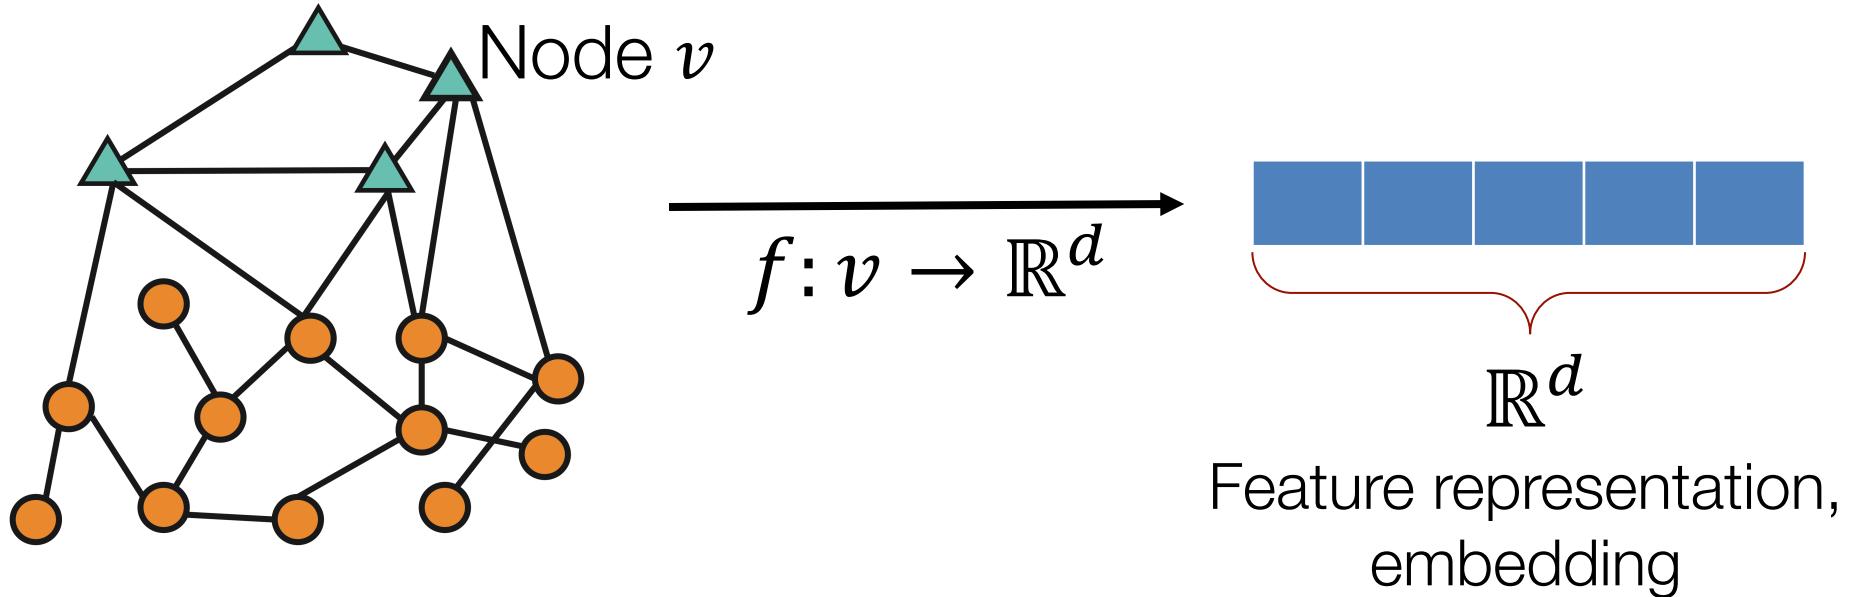

1. Encoder: Take a multimodal network and learn an *embedding* for every node

2. Decoder: Use the learned embeddings to predict labeled edges between nodes

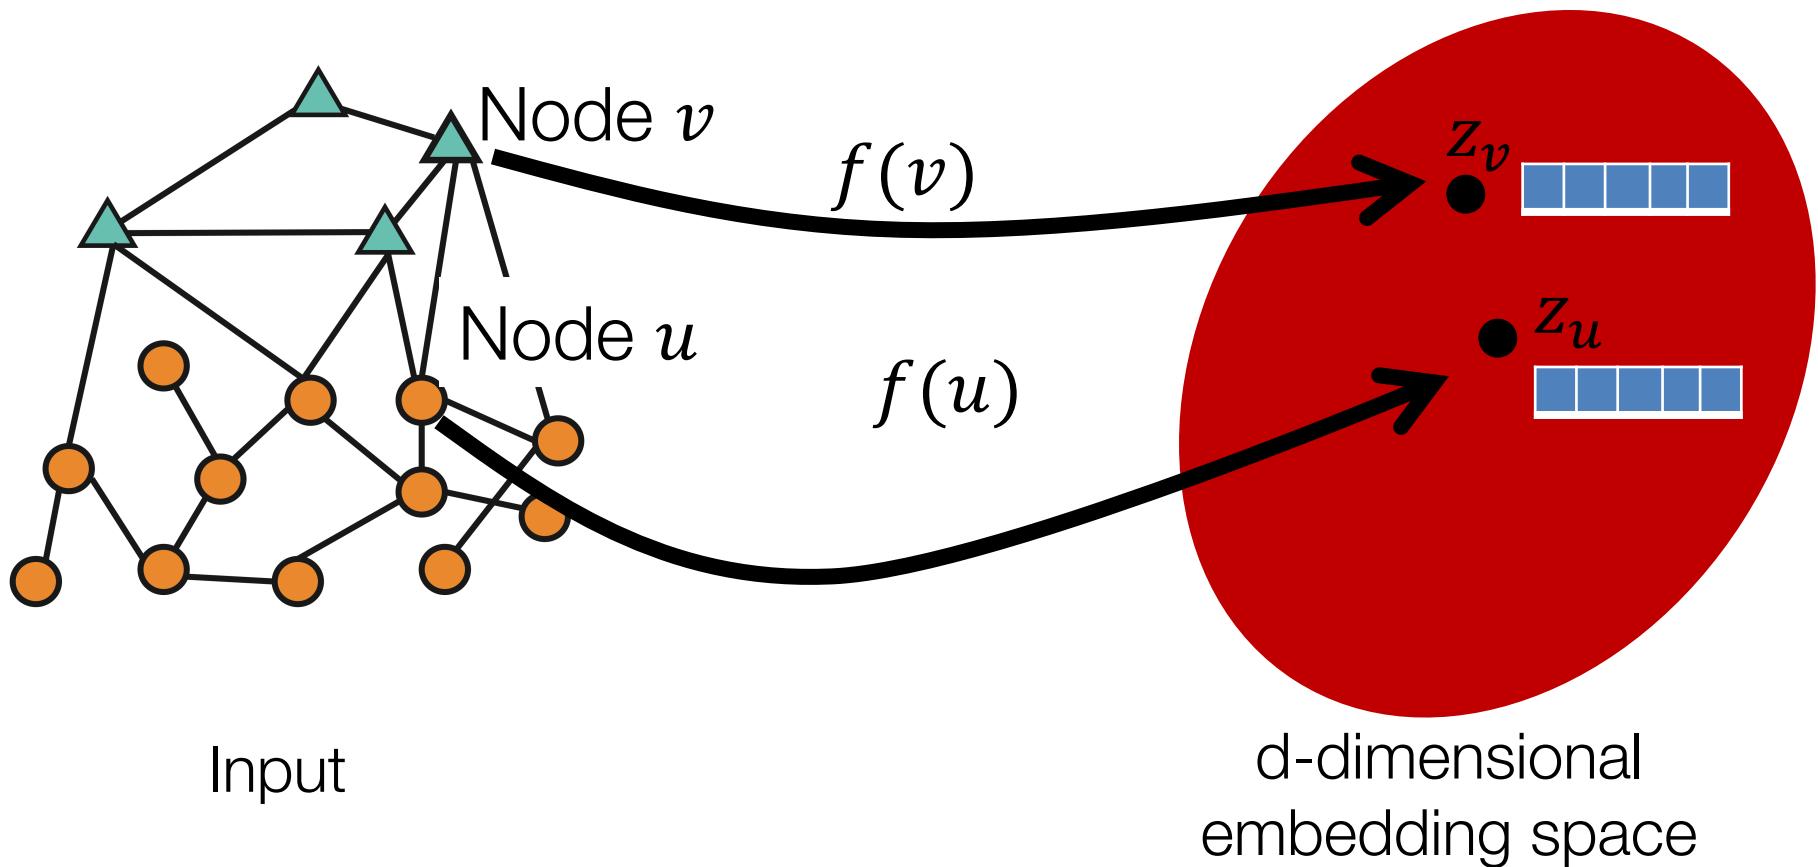

Embedding Nodes

Objective: Map nodes to d -dimensional embeddings such that nodes with similar network neighborhoods are embedded close together

Next: How to learn mapping function f ?

Embedding Nodes

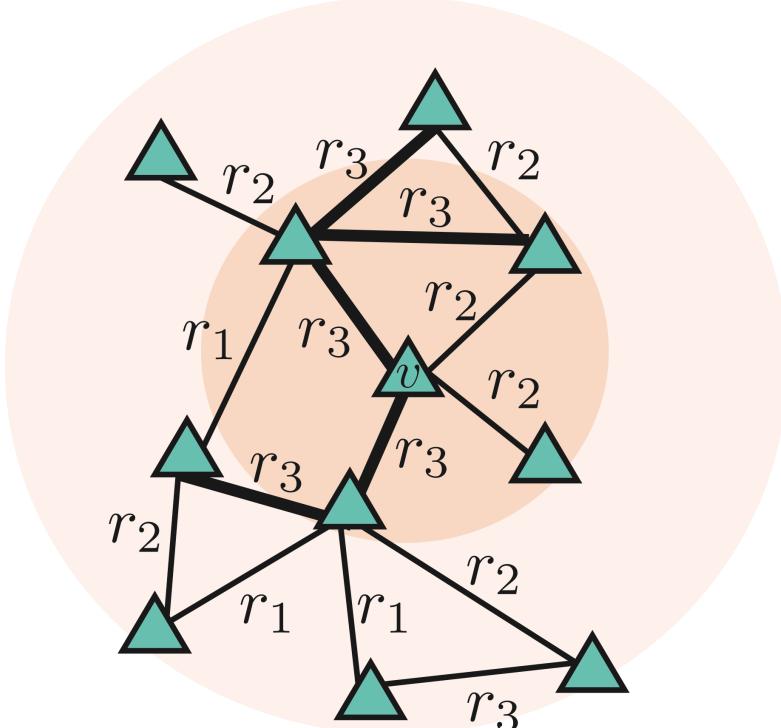

Goal: Map nodes to d-dimensional embeddings such that nodes with similar network neighborhoods are embedded close together

Key Idea: Aggregate Neighbors

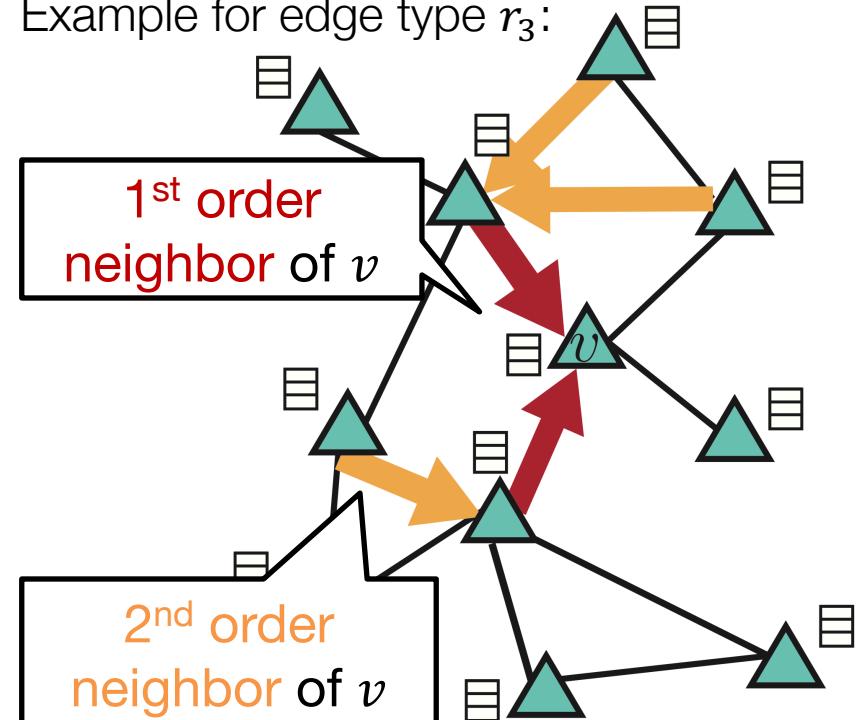

Generate embeddings based on **local network neighborhoods separated by edge type**

1) Determine a node's computation graph for each edge type

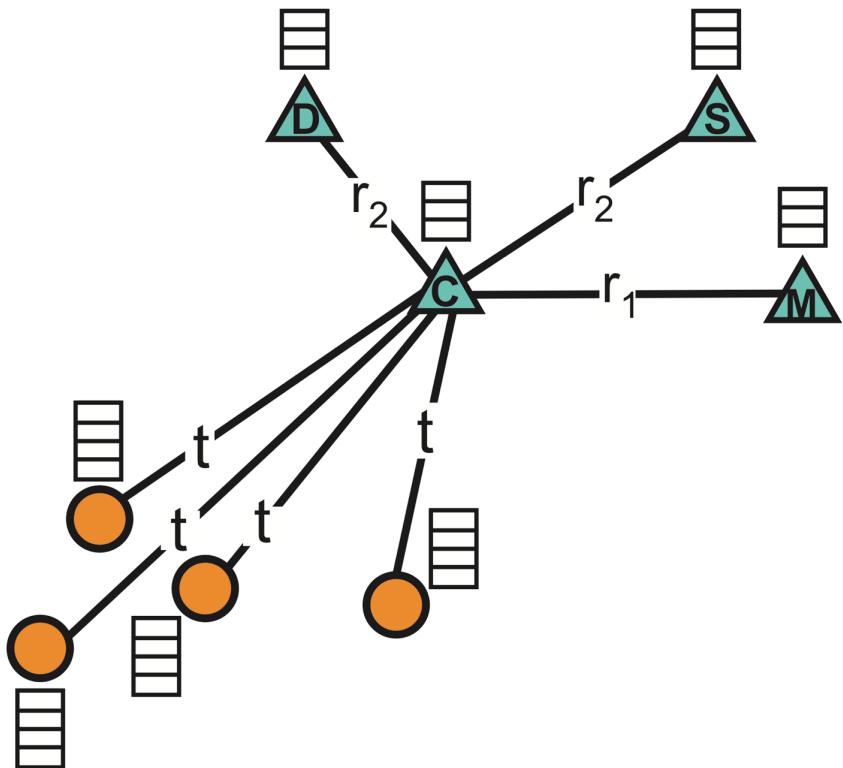

2) Learn how to transform and propagate information across computation graph

Example for edge type r_3 :

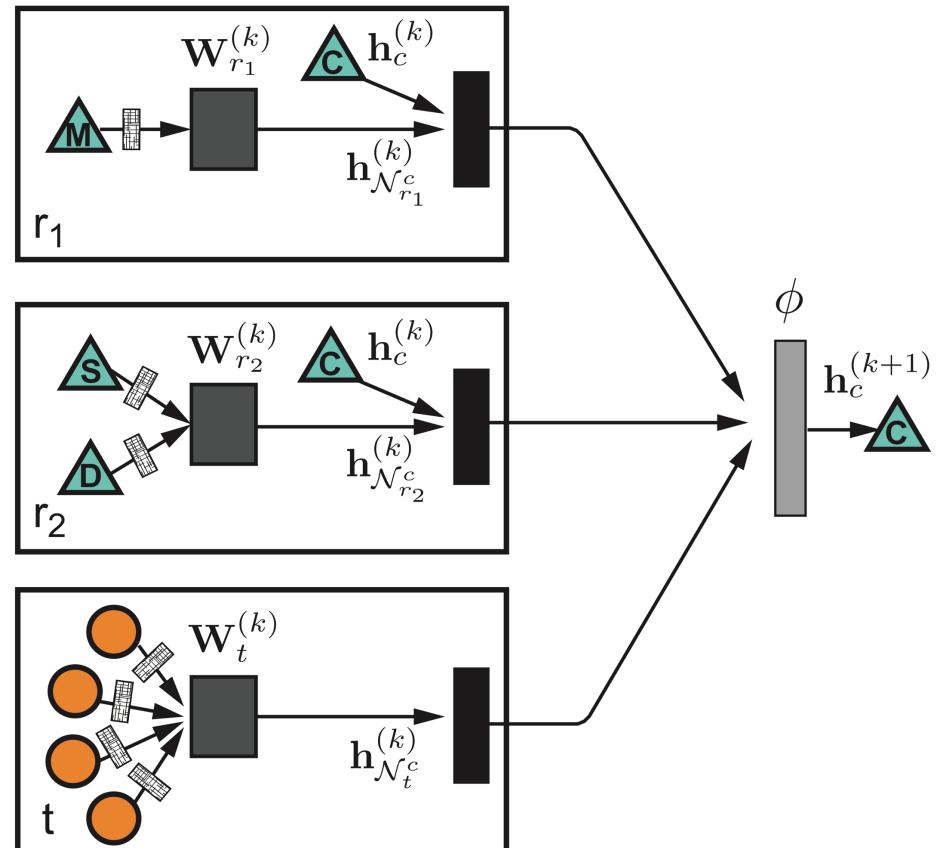

Example: Aggregate Neighbors

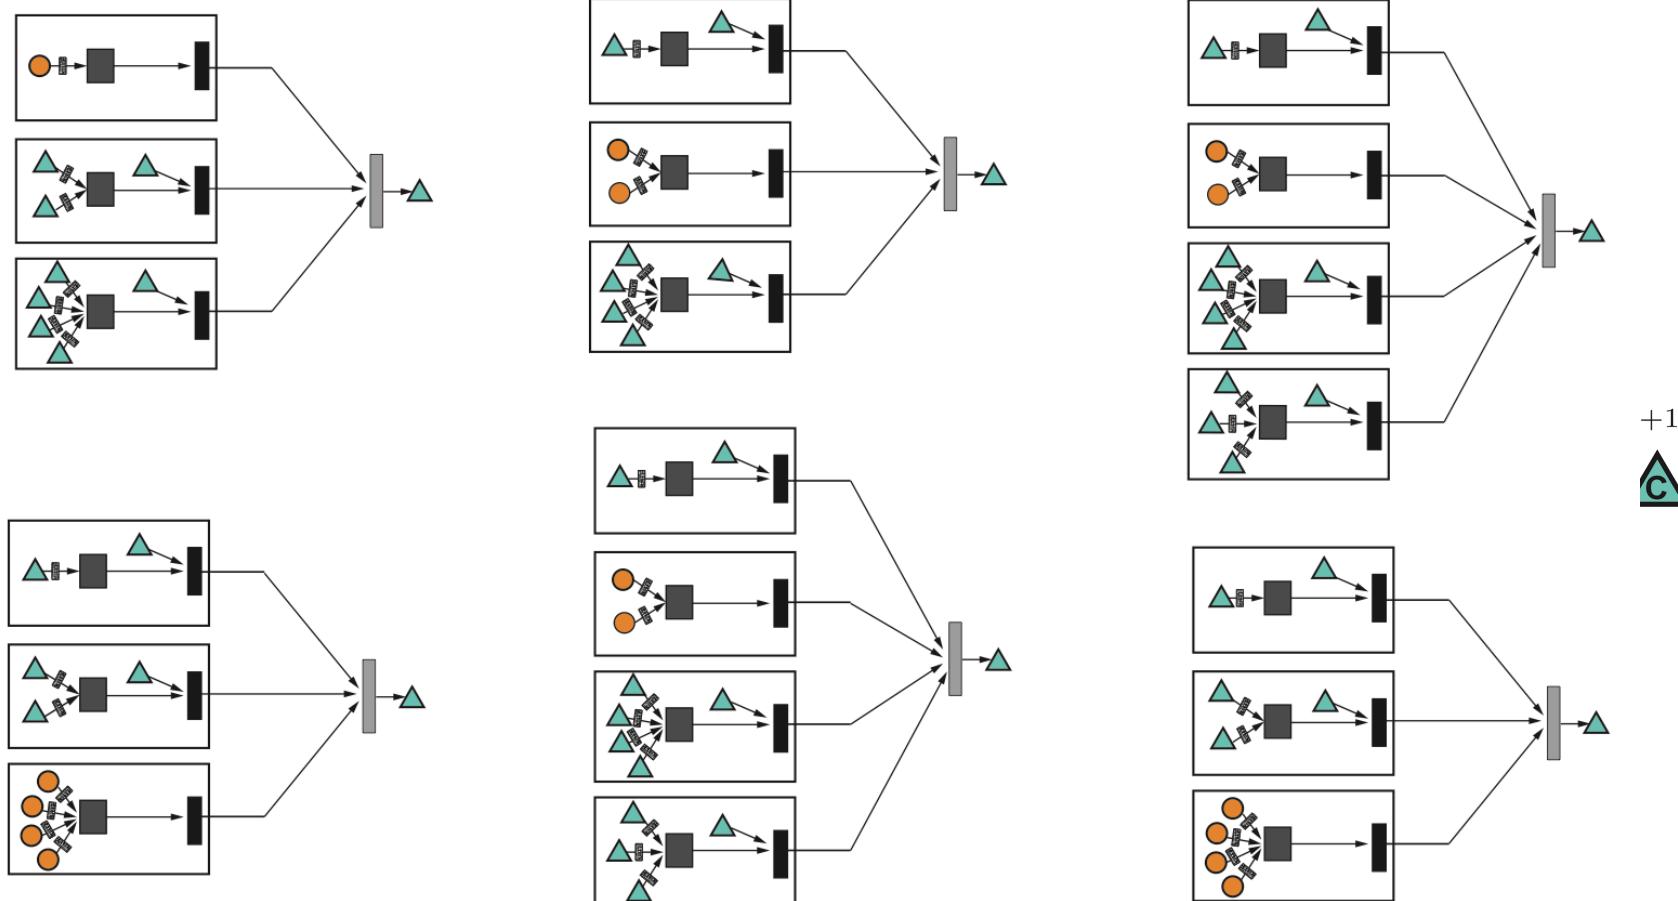

**1st order network
neighborhood of node C**

**1st order computation
graph of node C**

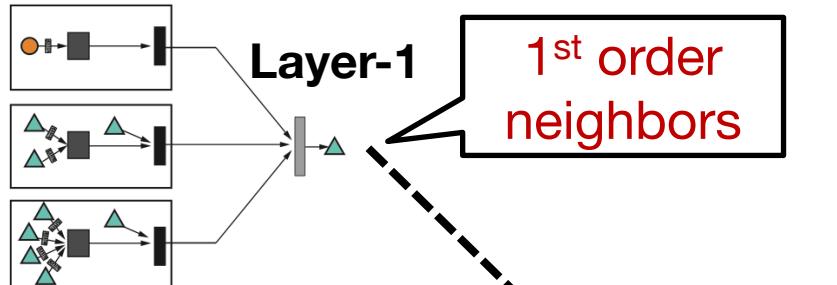

Every node learns how to aggregate its own neighbors

Every node defines a unique computation graph

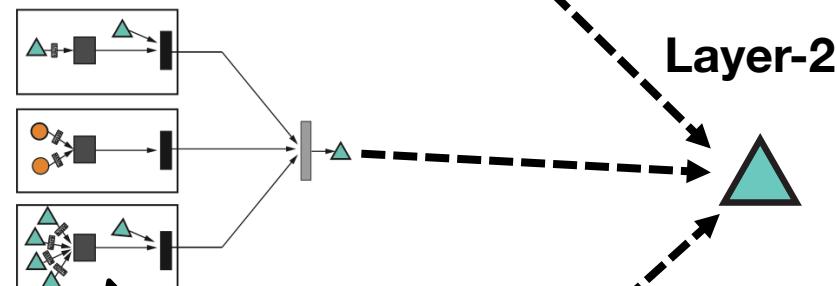

Deep Model: Many Layers

Layer-0

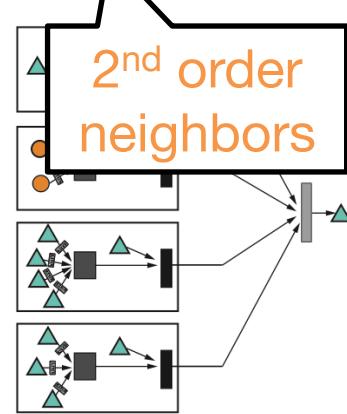

Layer-1

1st order
neighbors

Layer-2

Model can be of arbitrary depth:

- Nodes have embeddings at each layer
- Layer-0 embeddings are nodes' input features

Deep model with K layers:

- Convolves information across K^{th} order neighborhood
- Embedding of a node depends on nodes at most K hops away

Recap: Nodes with **similar network neighborhoods** are embedded **close together**

The Math: Deep Graph Encoder

Key element: Each node's computation graph defines a neural network with a different architecture

- Initial 0-th layer embeddings are equal to node features:

$$\mathbf{h}_v^{(0)} = \mathbf{x}_v$$

Aggregate neighbor's previous-layer embeddings, separated by edge type

Ability to integrate side information about nodes

- Per-layer update of node embeddings:

$$\mathbf{h}_v^{(k)} = \phi \left(\sum_r \sum_{u \in N_v^r} c_r^{uv} \mathbf{W}_r^{(k-1)} \mathbf{h}_u^{(k-1)} + c_r^v \mathbf{h}_v^{(k-1)} \right)$$

Previous-layer embedding of v

$k = 1, \dots, K$

- Embeddings after K layers of neighborhood aggregation:

$$\mathbf{z}_v = \mathbf{h}_v^{(K)}$$

$$\mathbf{W}_r^{(k)} \text{ Par}$$

Normalization constant, fixed e.g., $1/|N_v^r|$, or learned

Overview of our deep learning approach for multimodal networks

1. Encoder: Take a multimodal network and learn an *embedding* for every node

2. Decoder: Use the learned embeddings and make predictions

What Can We Predict?

- **Node prediction:** E.g., Predicting protein functions across tissues
- **Pairs of nodes:** E.g., Predicting side-effects and safety of drug combinations
- **Subgraph prediction:** E.g., Predicting what drug treats what disease
- **Graph prediction:** E.g., Predicting properties of molecules

We can now apply deep learning much more broadly, not only to medical images and biological, DNA sequences

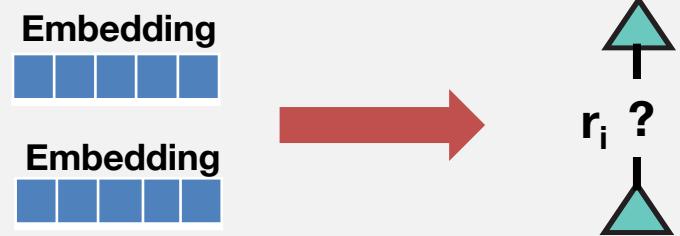

New frontiers for applications in **biology** and **medicine**

Overview of our deep learning approach for multimodal networks

1. Encoder: Take a multimodal network and learn an *embedding* for every node

2. Decoder: Use the learned embeddings and make predictions

Training the model: Feed embeddings into any loss function and run stochastic gradient descent to train weight parameters:

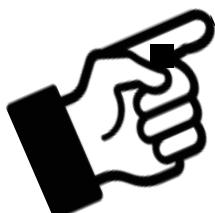

- Use a loss based on e.g., random walks, node proximity in the graph
- Directly train the model for a supervised task (e.g., node classification)

Today's Talk

1. Representation learning for biomedical data

2. Three research applications:

Used new approach to predict **safety** and **side effects of drug combinations**

- Used new approach to **repurpose old drugs for new diseases**
- Used new approach to **answer logical queries** on **knowledge graphs**

Polypharmacy

Patients take multiple drugs to treat complex or co-existing diseases

46% of people over 65 years take more than 5 drugs

Many take more than **20** drugs to treat heart diseases, depression or cancer

15% of the U.S. population affected by unwanted side effects

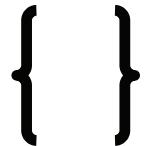

Annual costs in treating side effects exceed **\$177** billion in the U.S. alone

Unexpected Drug Interactions

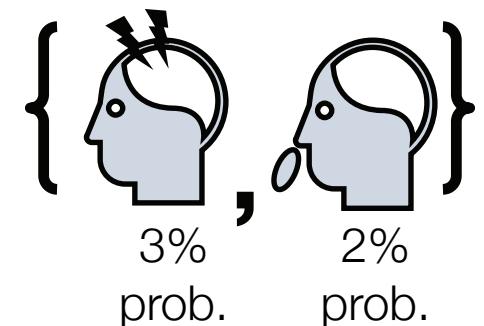

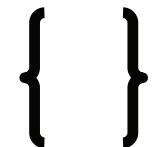

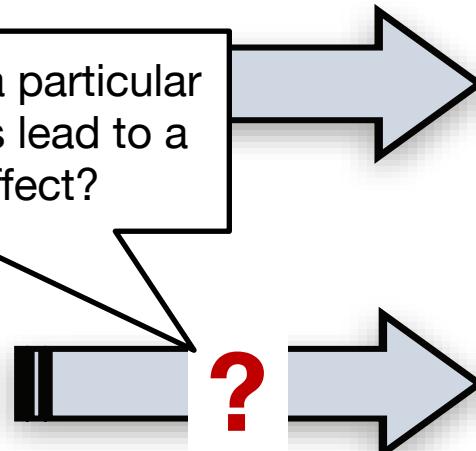

Co-prescribed drugs

Side Effects

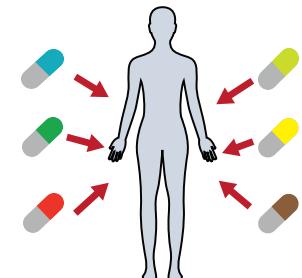

Task: How likely will a particular combination of drugs lead to a particular side effect?

Why is modeling polypharmacy hard?

Combinatorial explosion

- >13 million possible combinations of 2 drugs
- >20 billion possible combinations of 3 drugs

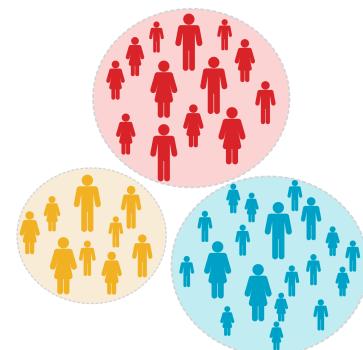

Non-linear & non-additive interactions

- Different effect than the additive effect of individual drugs

Small subsets of patients

- Side effects are interdependent
- No info on drug combinations not yet used in patients

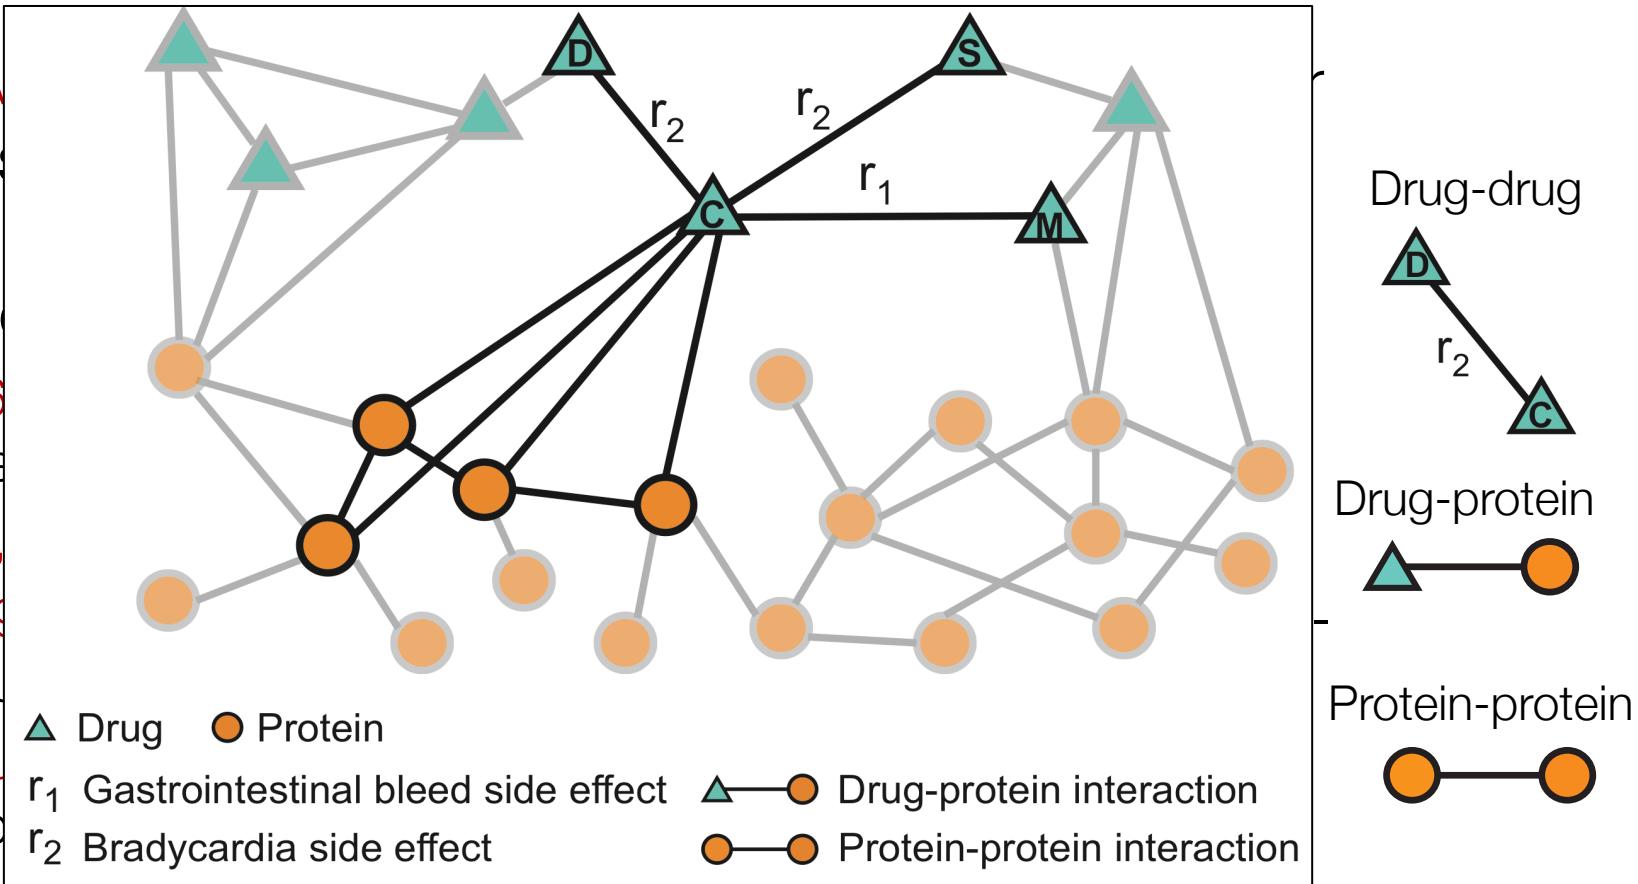

We need polypharmacy dataset

Objective
all drugs

We build

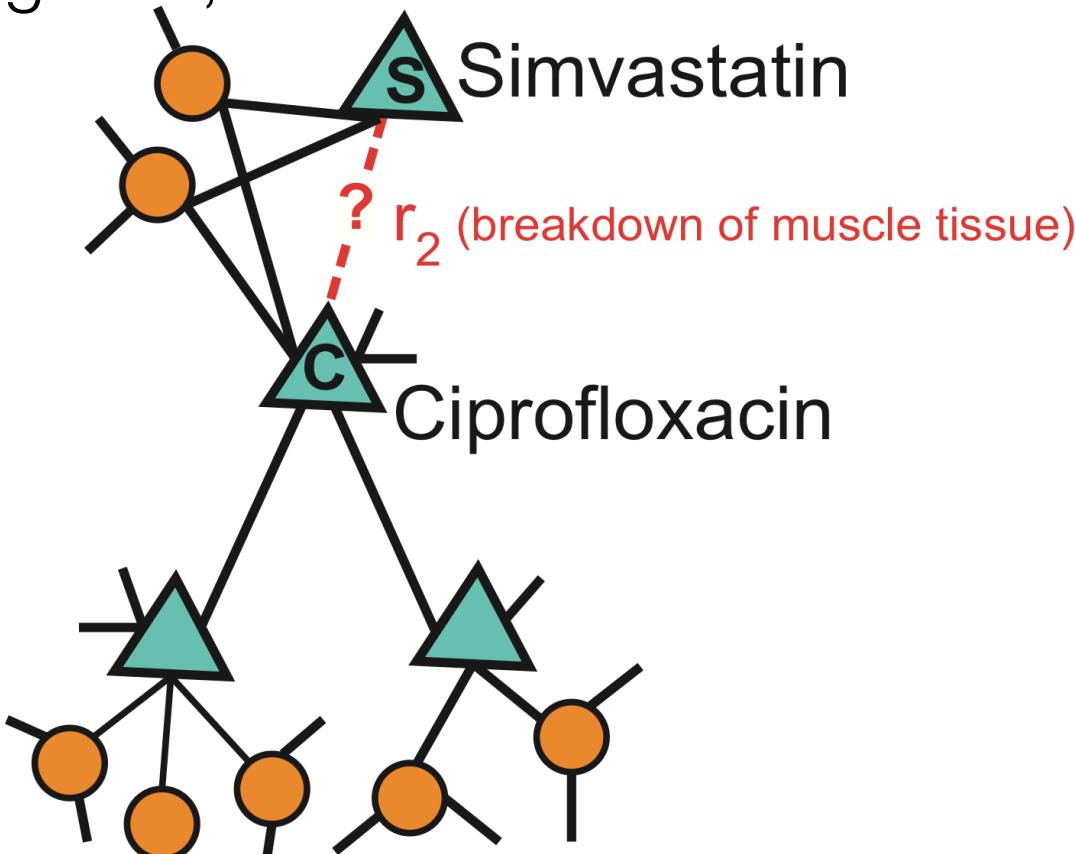

- 4,600 drugs
- 18,000 proteins
- 719,000 drug-protein interactions
- Drug-drug interactions

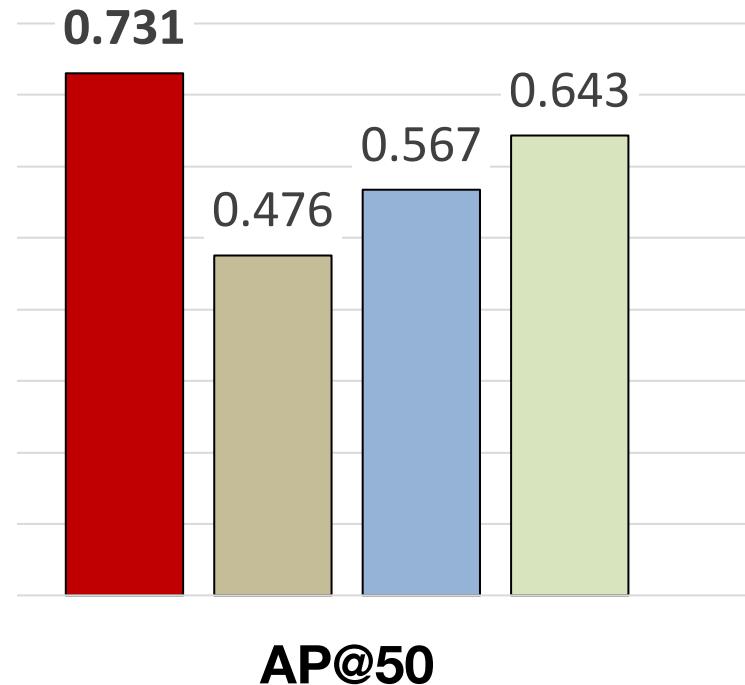

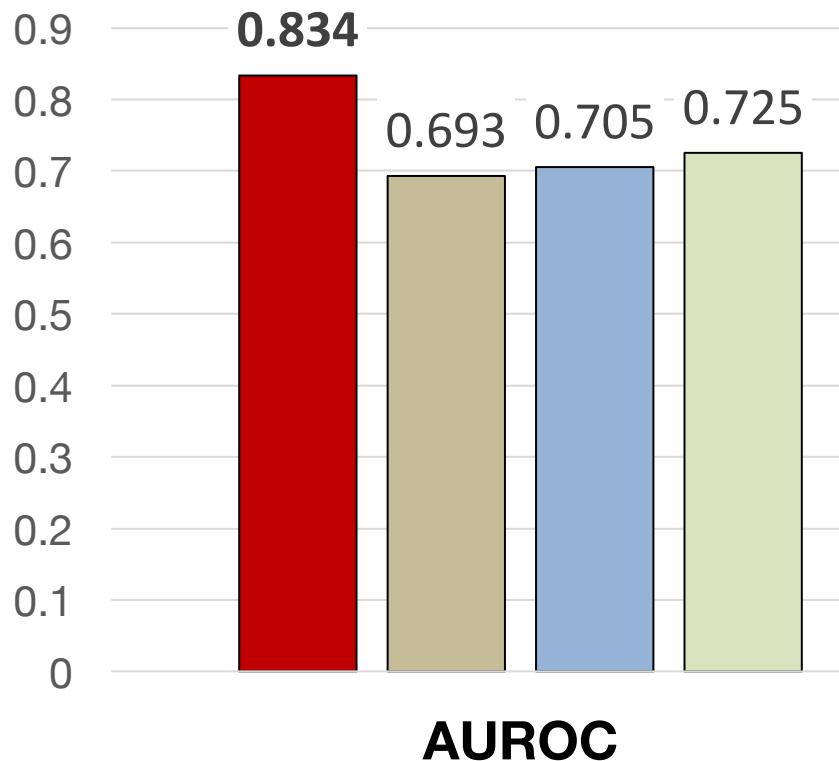

A polypharmacy network with over 5 million edges and
over 1,000 different edge types

We apply our deep approach to the polypharmacy network

E.g.: How likely will Simvastatin and Ciprofloxacin, when taken together, break down muscle tissue?

Results: Side Effect Prediction

- Our method (Decagon)
- RESCAL Tensor Factorization [Nickel et al., ICML'11]
- Multi-relational Factorization [Perros, Papalexakis et al., KDD'17]
- Shallow Network Embedding [Zong et al., Bioinformatics'17]

New Predictions

First AI method to **predict side effects of drug combinations**, even for combinations not yet used in patients

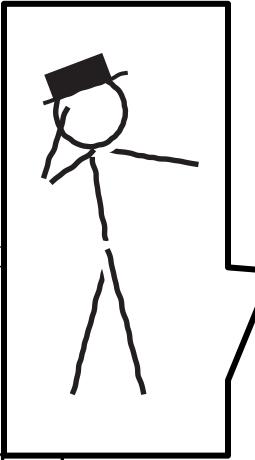

Next: Can the method generate hypotheses and give:

- **Doctors** guidance on whether it is a good idea to prescribe a particular combination of drugs to a particular patient
- **Researchers** guidance on effective wet lab experiments and new drug therapies with fewer side effects

New Predictions

Approach:

- 1) Train deep model on data generated **prior to 2012**
- 2) How many **predictions** have been **confirmed after 2012?**

Rank	Drug	Drug	Side effect	Evidence found
1	Pyrimethamine	Aliskiren	Sarcoma	
2	Tigecycline	Bimatoprost	Autonomic n.	
3	Telangiectases	Omeprazole	Dacarbazine	
4	Tolcapone	Pyrimethamine	Blood brain	

Case Report

Severe Rhabdomyolysis due to Presumed Drug Interactions between Atorvastatin with Amlodipine and Ticagrelor

7	Anagrelide	Azelaic acid	Cerebral thrombosis
8	Atorvastatin	Amlodipine	Muscle inflammation
9	Aliskiren	Tioconazole	Breast inflammation
10	Estradiol	Nadolol	Endometriosis

Clinical Validation of New Predictions

Drug interaction markers, lab values, and many other surrogates

MEDICINE

Today's Talk

- ✓ 1. **Representation learning** for biomedical data
- ✓ 2. Three research applications:
 - Used new approach to predict **safety** and **side effects of drug combinations**
 - Used new approach to **repurpose old drugs for new diseases**
 - Used new approach to **answer logical queries** on **knowledge graphs**

New tricks for old drugs

Goal: Find which diseases a drug (new molecule) could treat

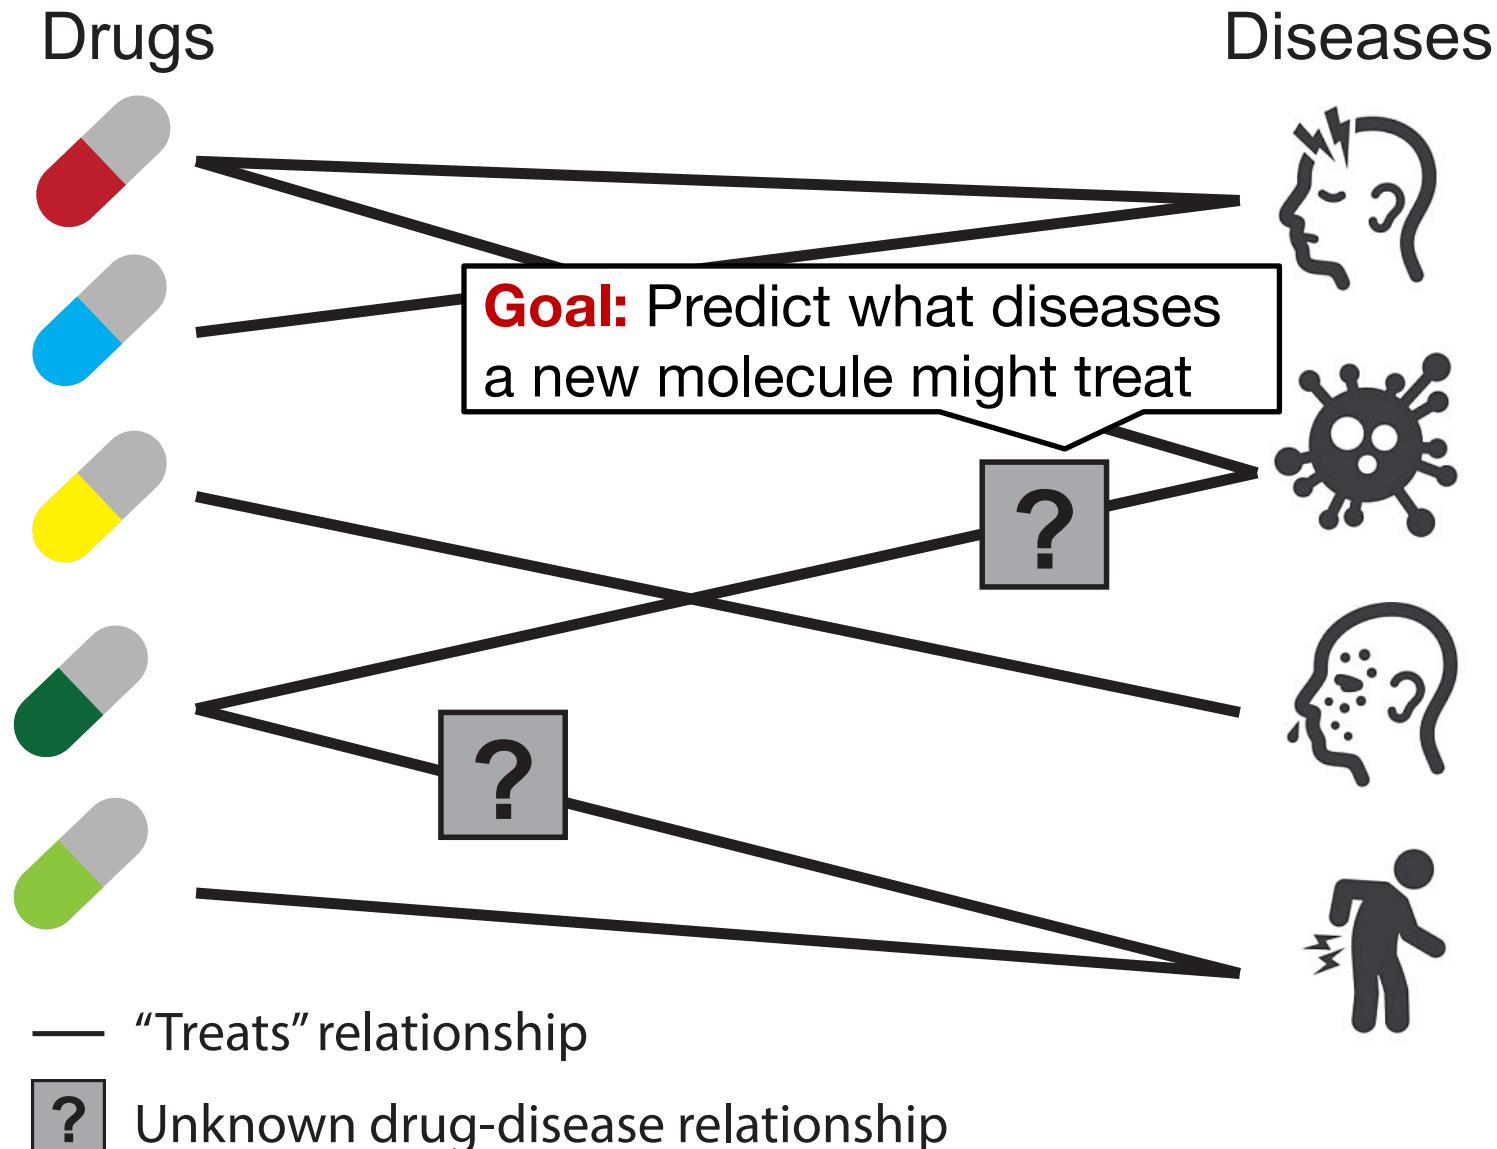

A SHORTER TIMESCALE

Because most repositioned drugs have already passed the early phases of development and clinical testing, they can potentially win approval in less than half the time and at one-quarter of the cost.

Drug repositioning

~6 years, ~\$300 million

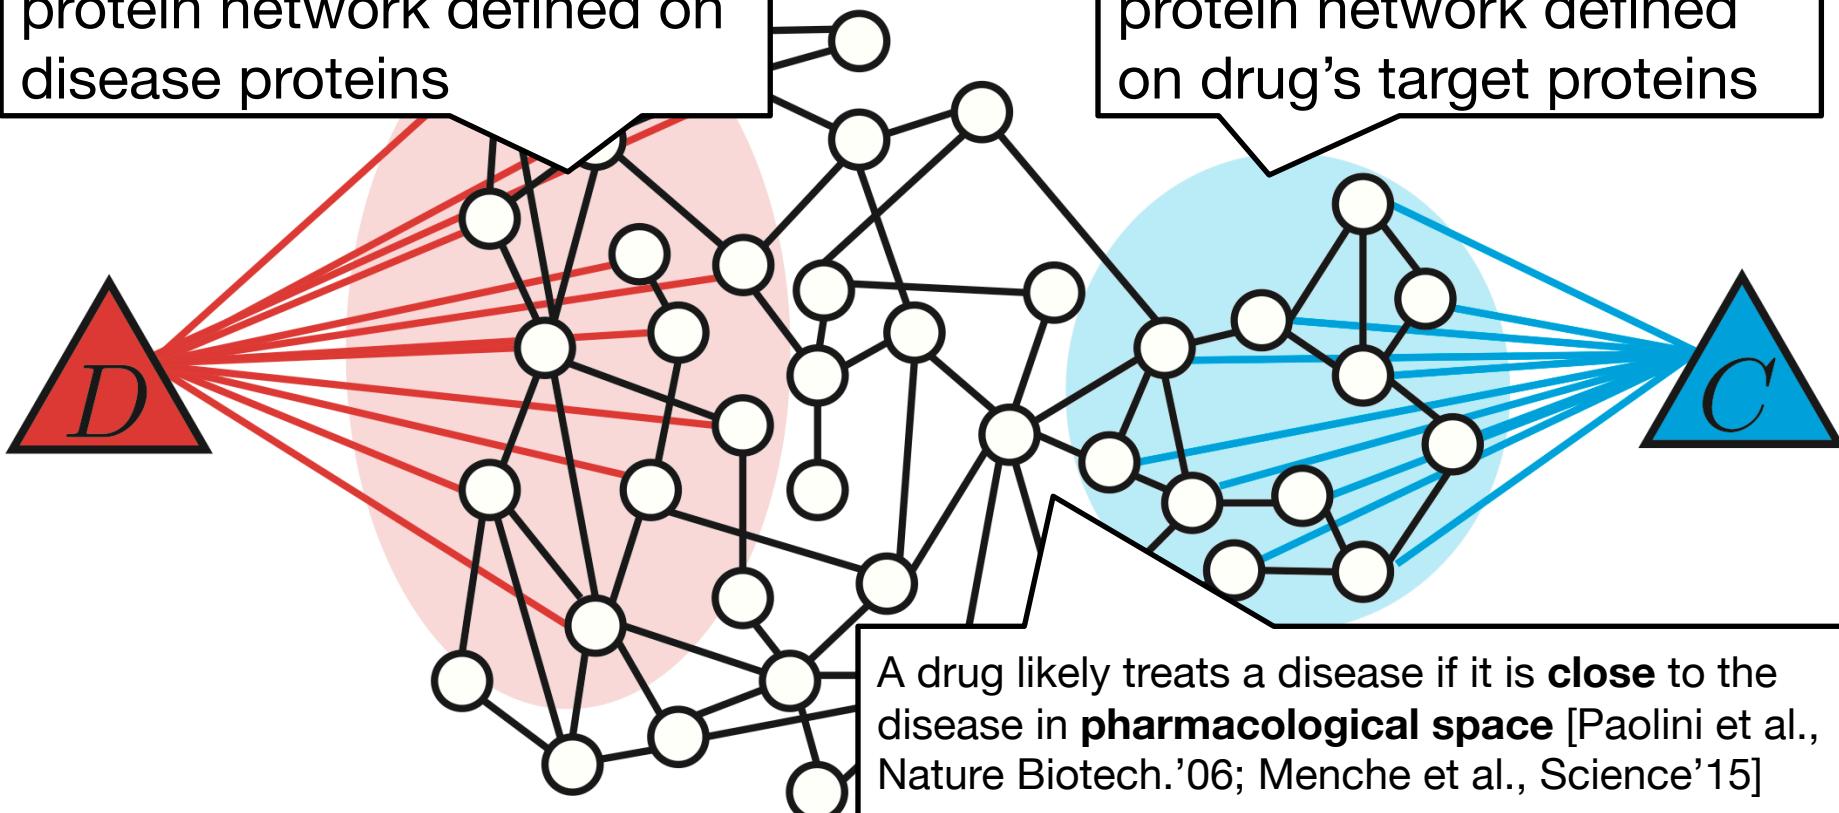

What drug treats what disease?

Key Insight: Subgraphs

Disease: Subgraph of rich protein network defined on disease proteins

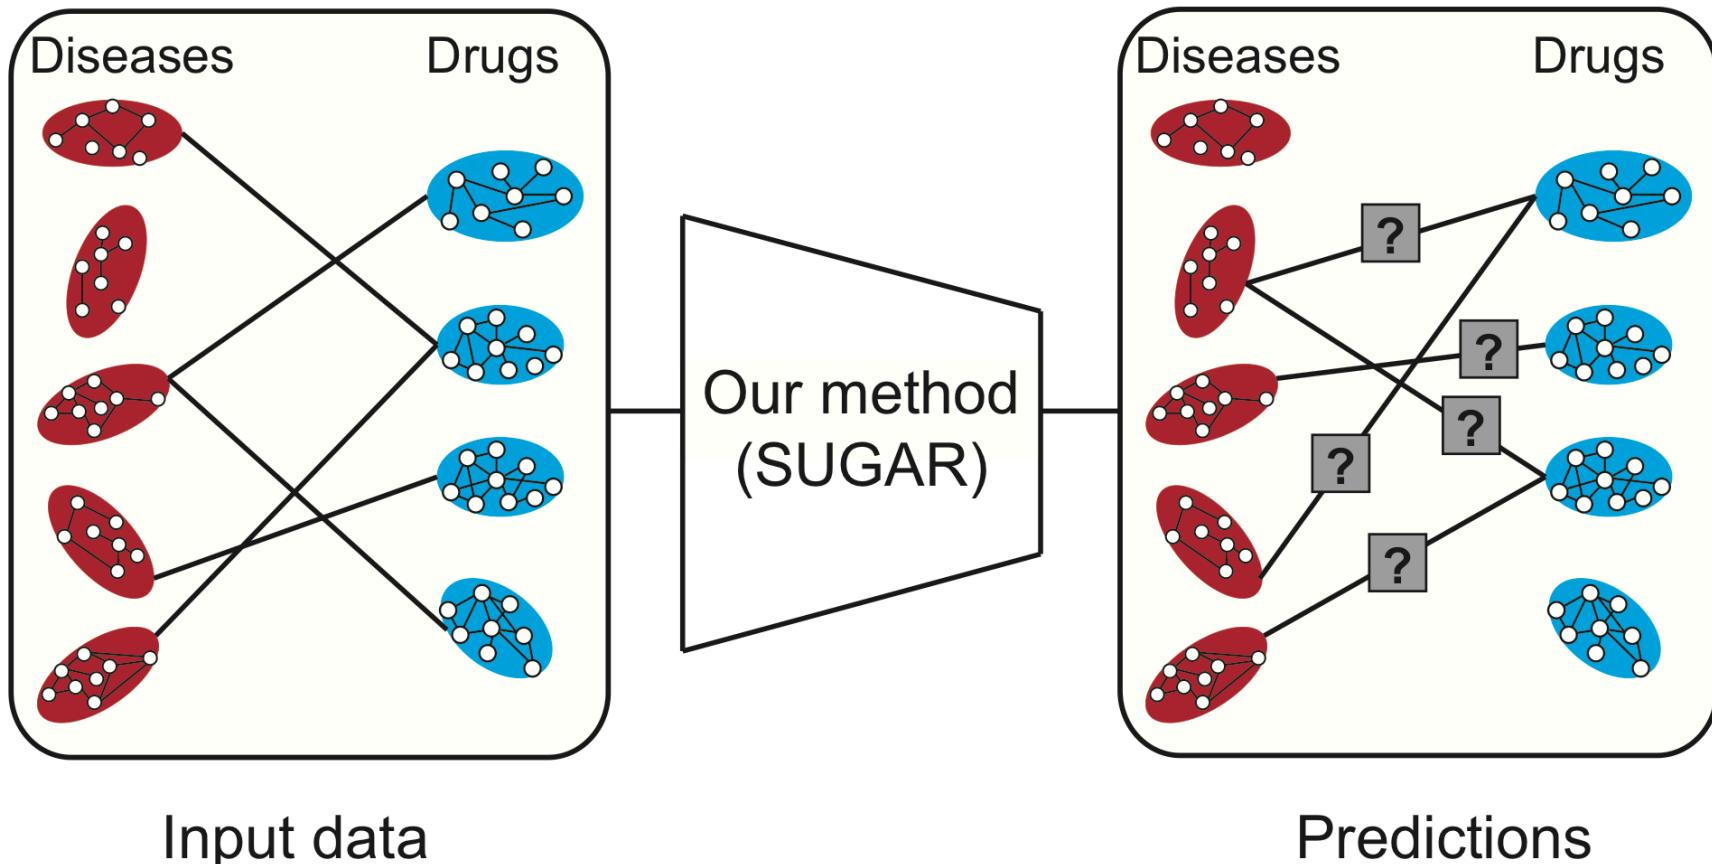

Drug: Subgraph of rich protein network defined on drug's target proteins

Idea: Use the paradigm of embeddings to operationalize the concept of closeness in pharmacological space

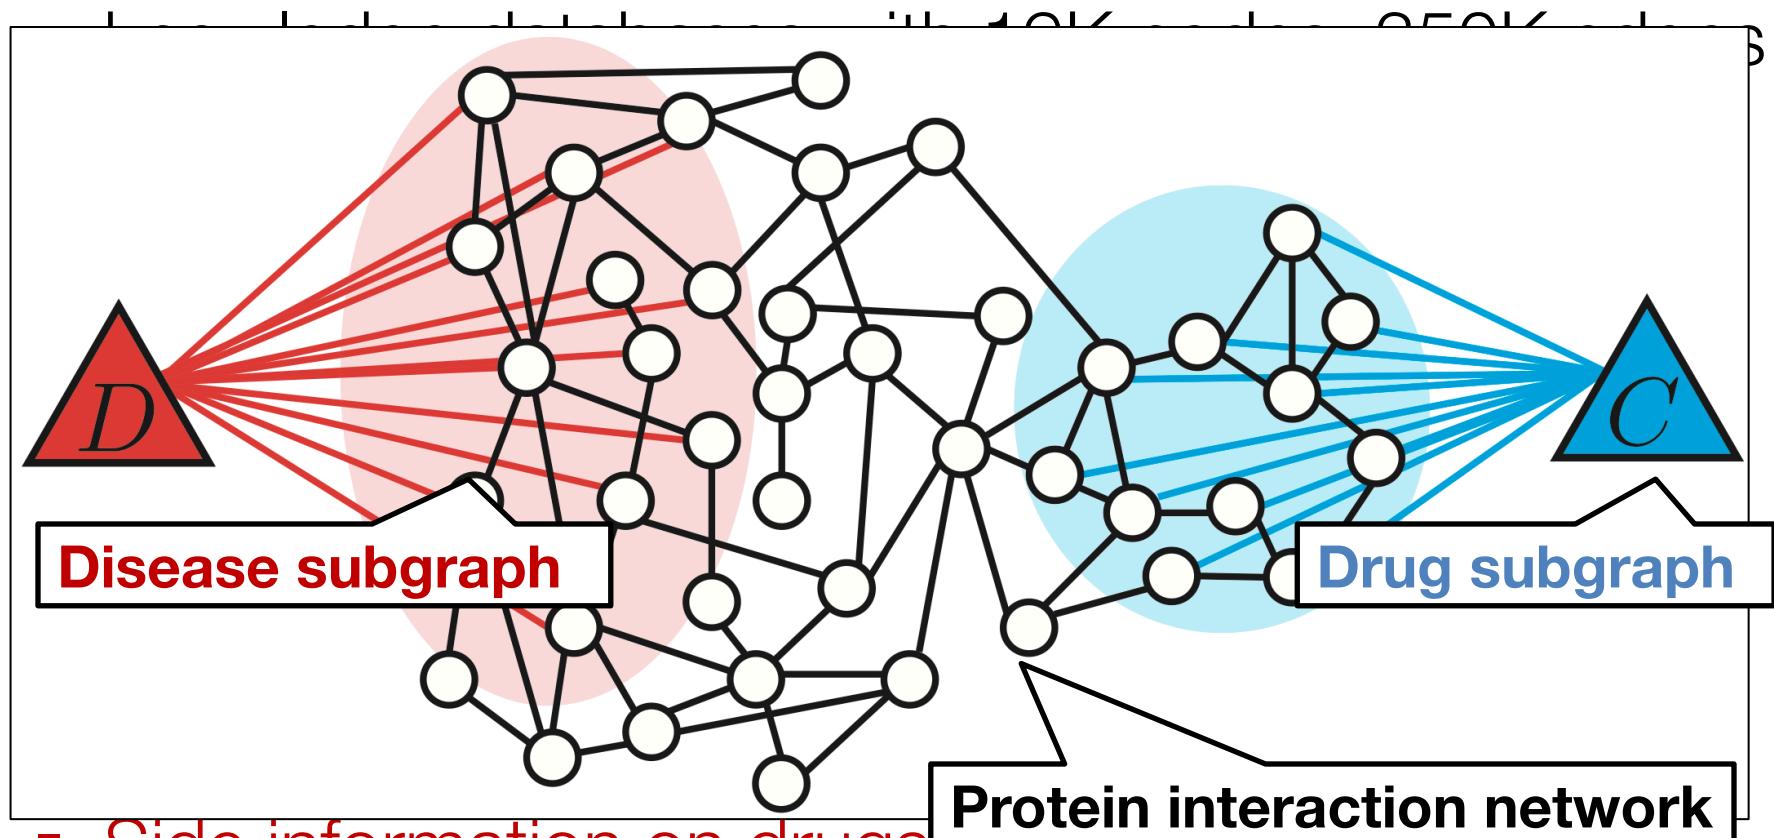

Predicting Links Between Drug and Disease Subgraphs

Task: Given drug C and disease D , predict if C treats D

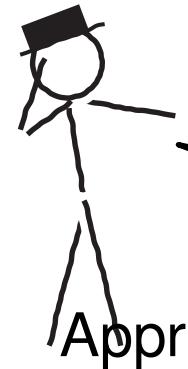

We need drug repurposing dataset

- Protein-protein interaction network culled from 15

- Side information on drugs, diseases, proteins, etc..
 - Molecular pathways, disease symptoms, side effects

Predictive Performance

Task: Given a disease and a drug,
predict if the drug could treat the disease

Approach

Feedbacks for the AI Loop

Explaining Machine Predictions

Key idea:

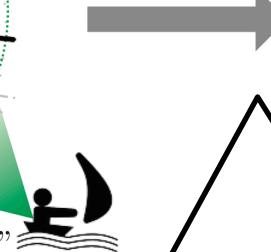

- Summarize where in the data the model “looks” for evidence for its prediction
- Find a small subgraph **most influential** for the prediction

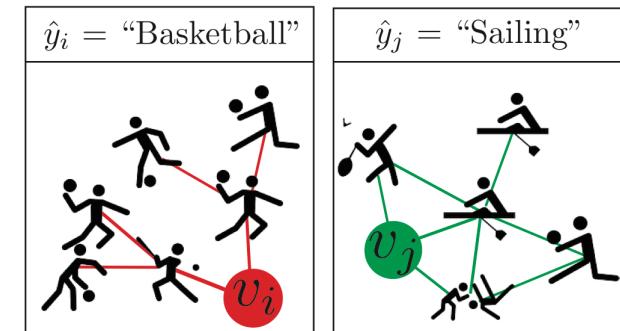

GNN model training and predictions

GNNExplainer

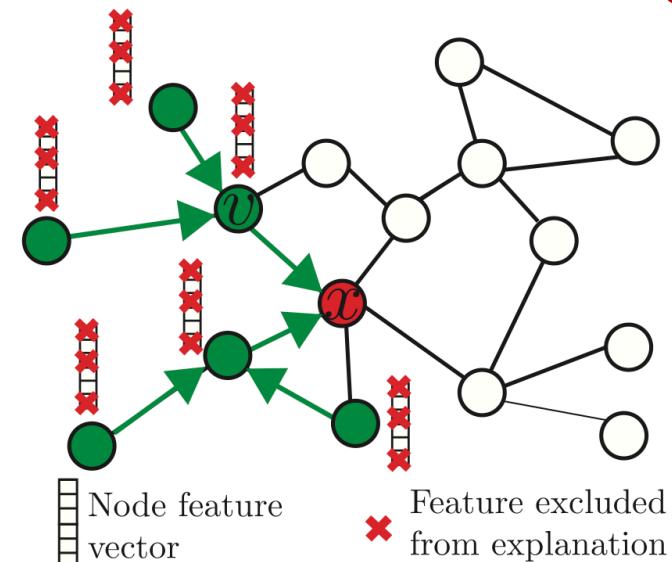

Explaining GNN’s predictions

Approach to generate explanations
using **counterfactual reasoning**

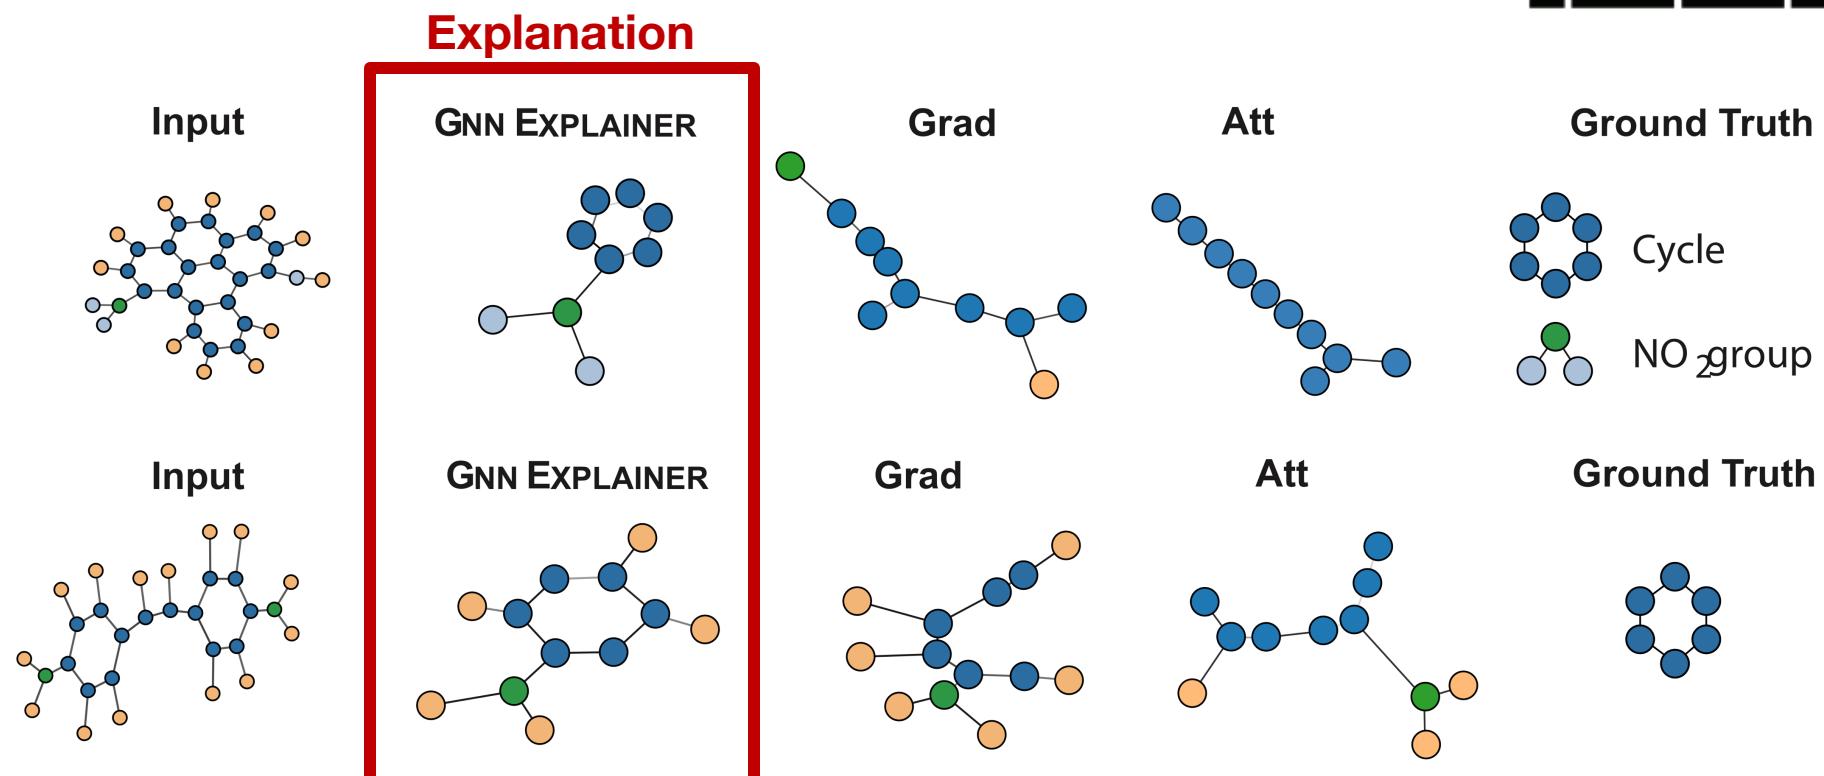

GNNExplainer: Key Idea

- **Input:** Given prediction $f(x)$ for node/link x
- **Output:** Explanation, a small subgraph M_x together with a small subset of node features:
 - M_x is most influential for prediction $f(x)$
- **Approach:** Learn M_x via **counterfactual reasoning**
 - **Intuition:** If removing v from the graph strongly decreases the probability of prediction $\Rightarrow v$ is a good counterfactual explanation for the prediction

GNNExplainer: Results

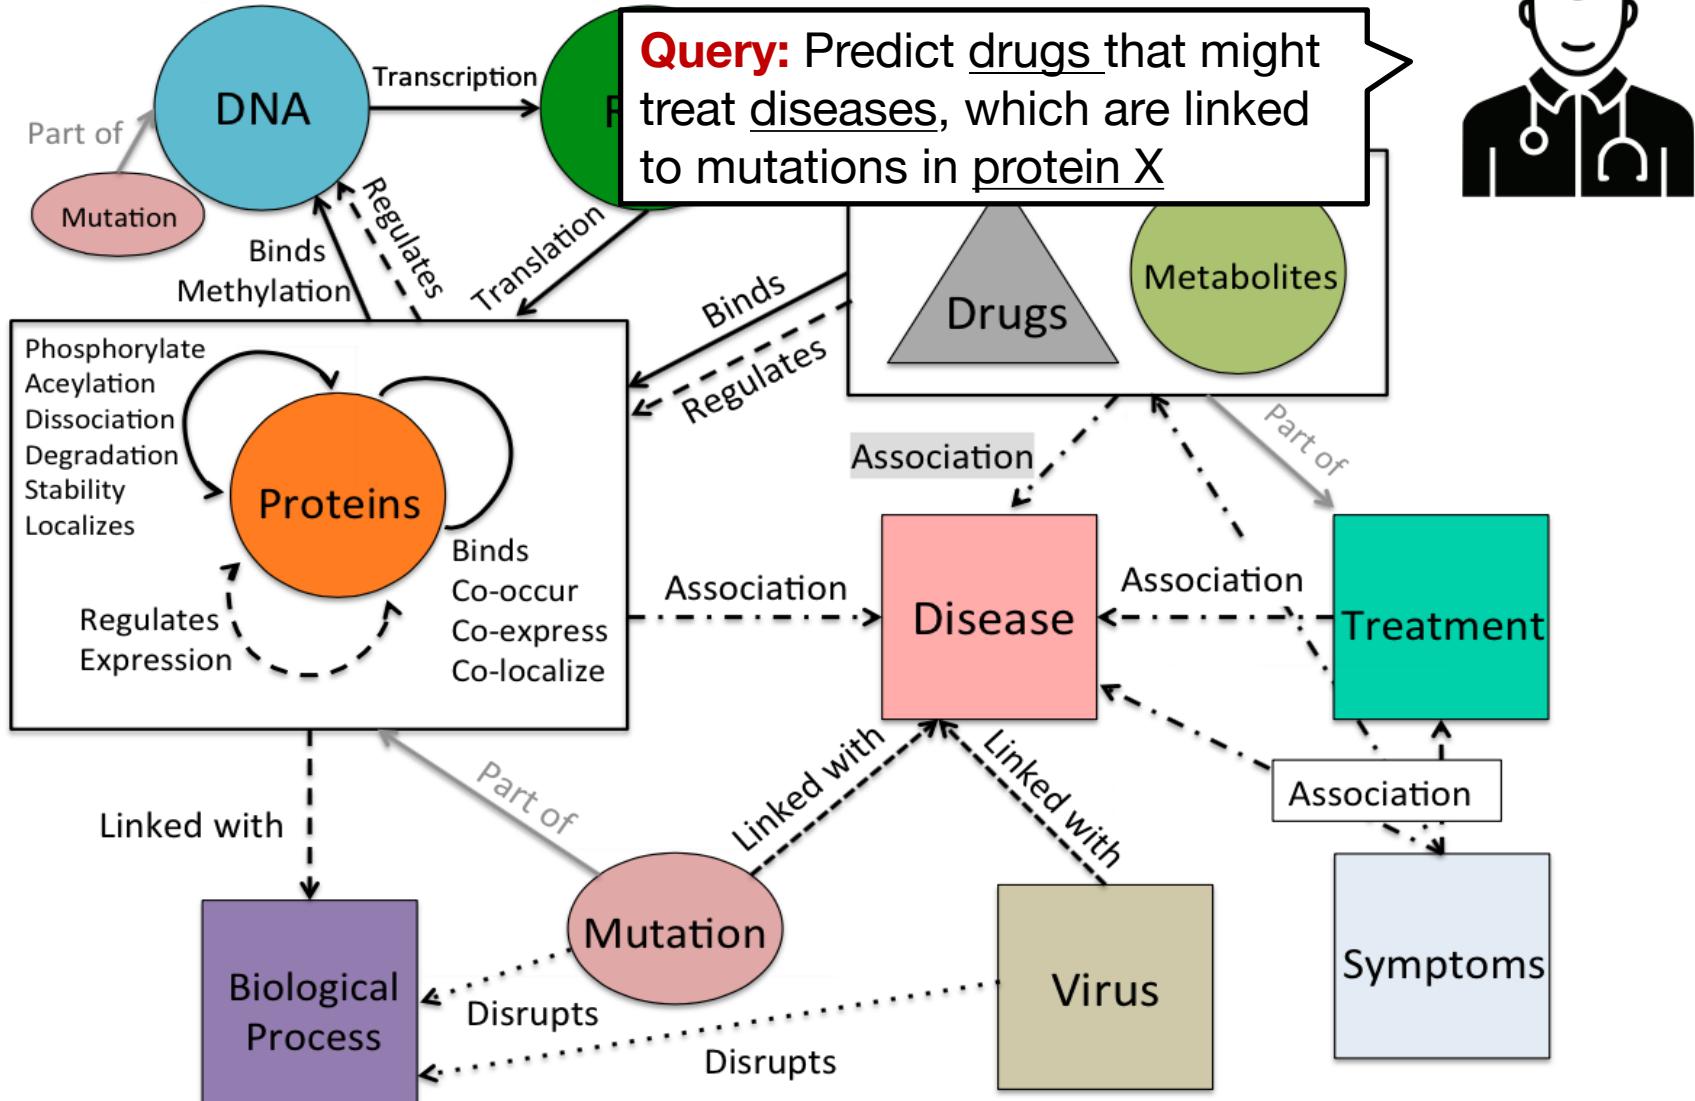

"Why did you predict that this molecule will have a mutagenic effect on Gram-negative bacterium *S. typhimurium*?"

Today's Talk

- ✓ 1. **Representation learning** for biomedical data
- ✓ 2. Three research applications:
 - Used new approach to predict **safety** and **side effects of drug combinations**
 - Used new approach to **repurpose old drugs for new diseases**
 -  Used new approach to **answer logical queries** on **knowledge graphs**

Knowledge Graphs

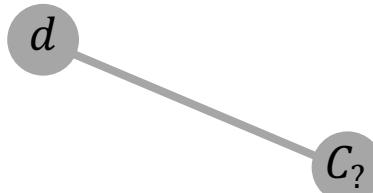

Learn over Knowledge Graphs

Simple edge prediction

Predict drugs $C_?$ that treat disease d

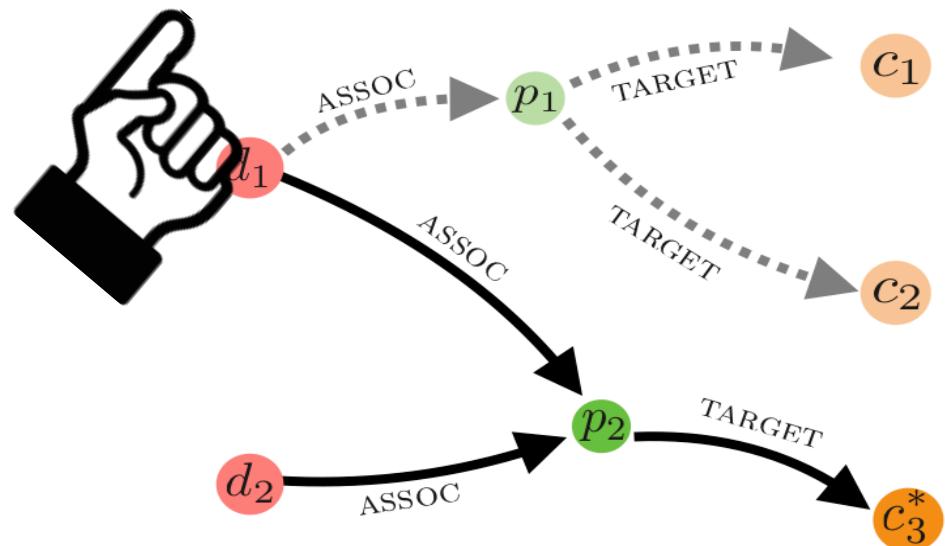

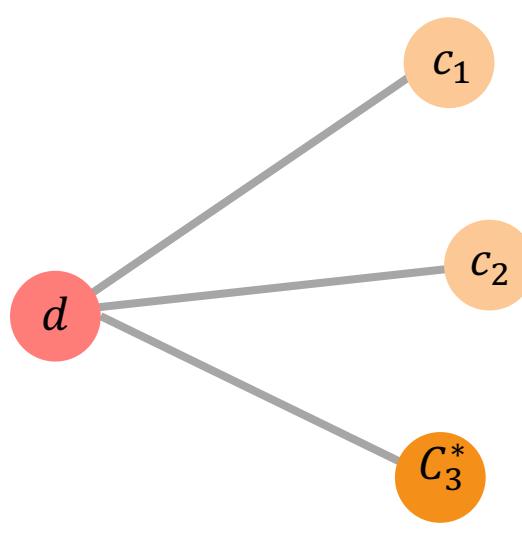

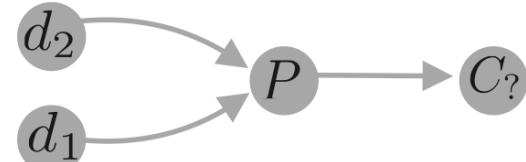

$$C_? : \text{TREAT}(C_?, d)$$

Answering logical queries

Predict drugs $C_?$ that might TARGET proteins, which are in turn ASSOCIATED with diseases d_1 and d_2

$$C_?. \exists P : \text{ASSOC}(d_1, P) \wedge \text{ASSOC}(d_2, P) \wedge \text{TARGET}(P, C_?)$$

Why is query prediction on knowledge graphs a hard problem?

1) Massive enumerations

- E.g., the protein node is an existentially quantified variable
- Need to enumerate over all possible protein nodes

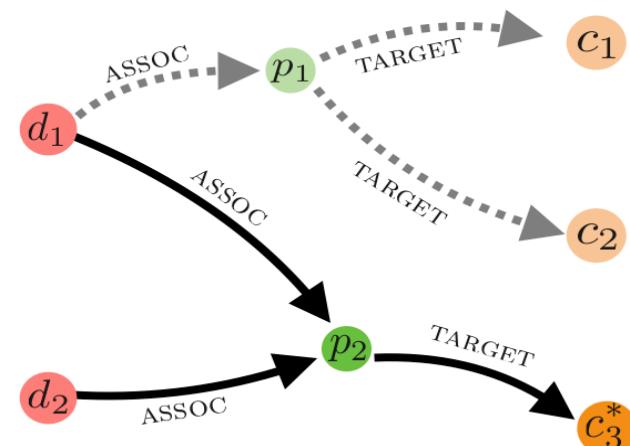

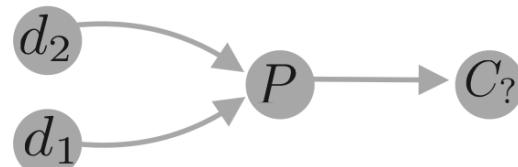

1) Exponential computations

- Combinatorial number of possible answers to the query
- Naive enumeration approach has exponential time complexity in the number of query variables

Logical query

Predict drugs $C_?$ that might TARGET proteins, which are in turn ASSOCiated with diseases d_1 and d_2

$$C_? \cdot \exists P : \text{ASSOC}(d_1, P) \wedge \text{ASSOC}(d_2, P) \wedge \text{TARGET}(P, C_?)$$

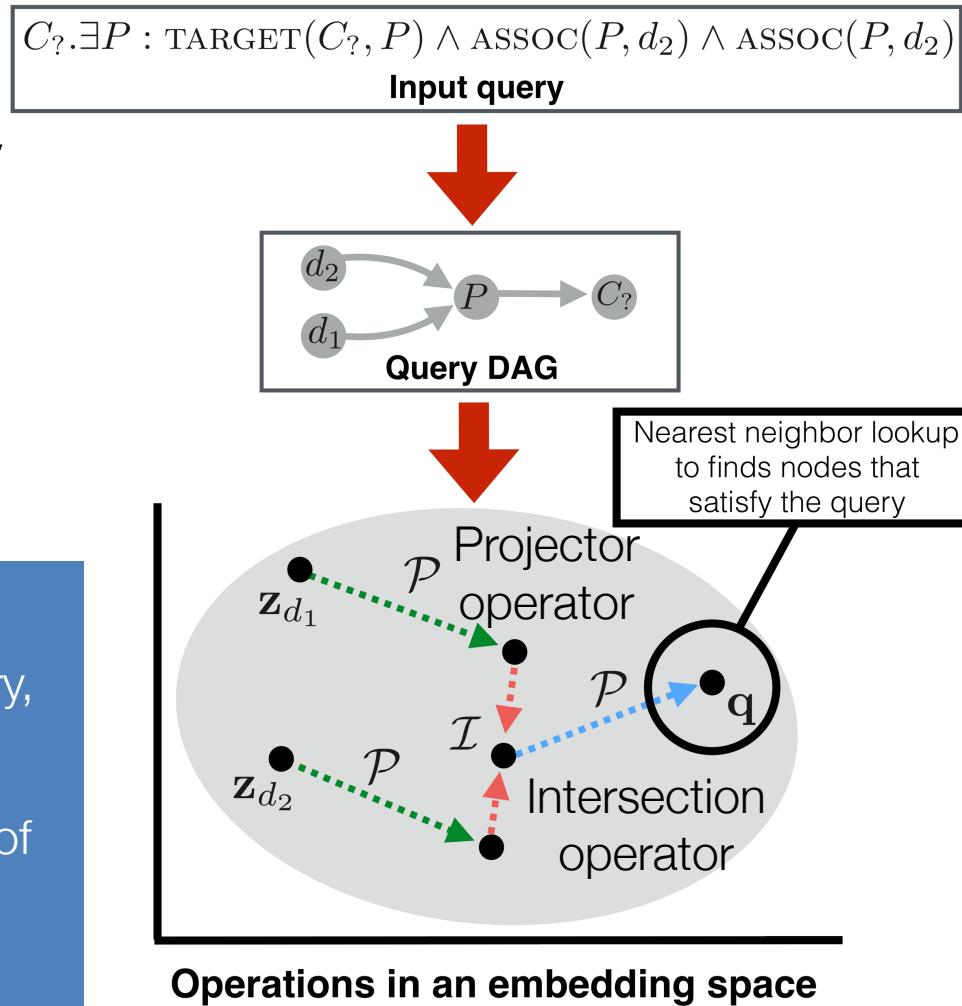

Approach: Query Embeddings

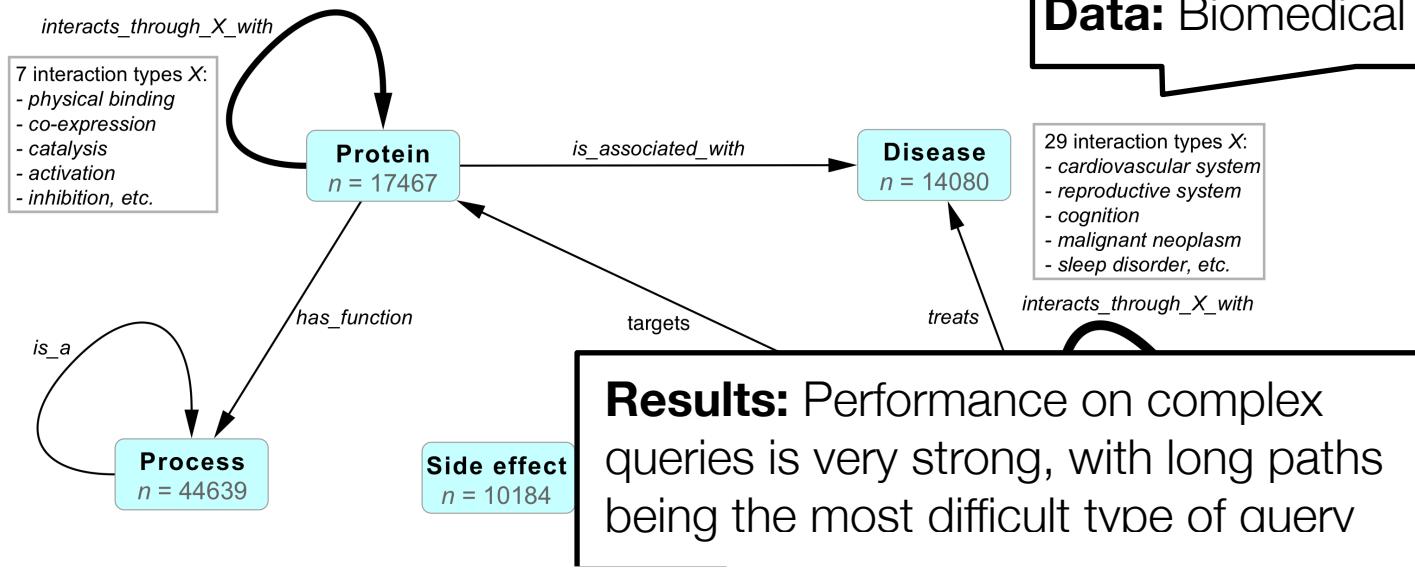

Two key steps:

- 1) Generate an embedding for every node in the graph
- 2) Represent **logical operators** as **learned geometric operations** (e.g., translation, rotation) in this embedding space

- **Any conjunctive query:** Can predict which nodes are likely to satisfy any query, even if it involves unobserved edges
- **Efficient:** Linear time complexity in size of the query and constant in size of the knowledge graph

Query Embeddings: Results

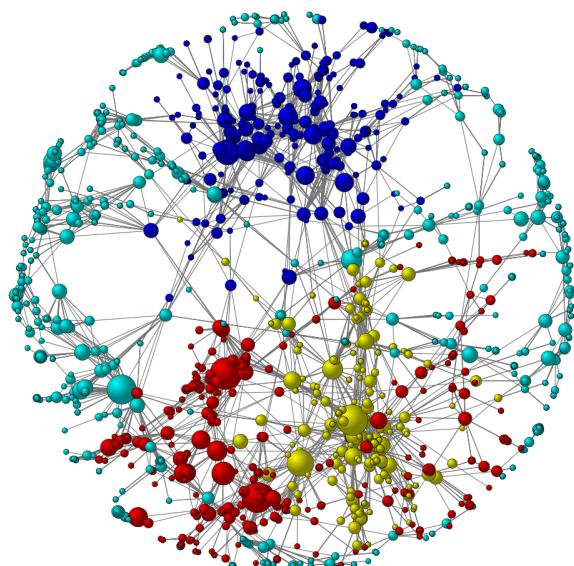

Results: Ablated models that are only trained on edge prediction perform much worse than query embeddings

Summary of Results

1. Used new approach to **predict safety and side effects of drug combinations:**
 - First-ever systematic and predictive study of **drug combinations**
 - **Follow-up research** on prostate cancer and validations in the clinic
2. Used new approach to **repurpose old drugs for new diseases:**
 - Outperforms baselines by up to 172%
 - Correctly predicted drugs repurposed at Stanford SPARK
3. Used new approach to **answer logical queries on knowledge graphs:**
 - *Predict drugs that might treat diseases linked to mutations in protein X*
 - Ability to answer logical queries in a linear instead of exponential time

Large datasets are transforming science and medicine

New machine learning methods can unlock these datasets and open doors for scientific discoveries
